* REAL NUMBER SYSTEM*

→ the set of natural numbers

$$N = \{1, 2, 3, \dots\}$$

→ the set of whole numbers

$$W = \{0, 1, 2, 3, \dots\}$$

→ the set of integers

$$I = \{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$$

→ the set of +ve integers

$$I^+ = \{1, 2, 3, \dots\}$$

→ the set of -ve integers

$$I^- = \{\dots, -3, -2, -1\}$$

→ the set of rational numbers

$$Q = \left\{ \frac{P}{q} \mid P, q \in I, q \neq 0 \right\}$$

→ the set of irrational numbers

Q' = the numbers which cannot be expressed in the form of P/q

($q \neq 0$) are known as irrational numbers.

Ex: $\sqrt{2}, \sqrt{5}, e, \pi$ etc.

Note:

→ (1). the rational number can be expressed either as a terminating decimal (or) non-terminating recurring decimal.

→ (2). An irrational number can be expressed as non-terminating non-recurring decimal.

the set of real numbers $I\mathbb{R}$ = $Q \cup Q'$

i.e. the set of real numbers $I\mathbb{R}$ which contains the set of rational and irrational numbers.

Note:

(1). NCWCIC & CIR and $Q' \subset I\mathbb{R}$.

(2). Between any two distinct consecutive integers, there exists no integer.

(3). Between any two distinct rational numbers, there lie infinitely many rational numbers.

(4). Between any two rational numbers there lie infinitely many irrational numbers.

(5). Between any two irrational numbers there lie infinitely many irrational numbers as well as infinitely many rational numbers.

(6). Between any two real numbers there lie infinitely many real numbers.

Note: The symbols \exists and \forall are known as Quantifiers and the symbols \Rightarrow , \Leftarrow as connectives.

→ Some important Properties of real numbers in the form of Axioms. These axioms can be

divided into three types:

1. Field axioms
2. Order axioms
3. Completeness axiom.

(1) Field Axioms:

Let \mathbb{R} be the set of real numbers, then the algebraic structure $(\mathbb{R}, +, \cdot)$ satisfies the following axioms.

(i) $(\mathbb{R}, +)$ is an abelian group.

i.e. (i) Closure Property:

$$\forall a, b \in \mathbb{R} \Rightarrow a+b \in \mathbb{R}$$

(ii) Associative Property:

$$\forall a, b, c \in \mathbb{R} \Rightarrow a+(b+c) = (a+b)+c$$

(iii) Existence of identity:

$$\forall a \in \mathbb{R}, \exists 0 \in \mathbb{R} \text{ such that}$$

$$a+0 = 0+a = a$$

the real number '0' is called the additive identity of \mathbb{R} .

(iv) Existence of Inverse:

$$\forall a \in \mathbb{R}, \exists b \in \mathbb{R} \text{ such that}$$

$$a+b = 0 = b+a$$

the real number 'b' is called the additive inverse of 'a'.

(v) Commutative Property:

$$\forall a, b \in \mathbb{R} \Rightarrow a+b = b+a$$

(ii) (\mathbb{R}, \cdot) is an abelian group.

i.e. (i) Closure Property:

$$\forall a, b \in \mathbb{R} \Rightarrow a \cdot b \in \mathbb{R}$$

(ii) Associative Property:

$$\forall a, b, c \in \mathbb{R} \Rightarrow a \cdot (b \cdot c) = (a \cdot b) \cdot c$$

(iii) Existence of Identity:

$$\forall a \in \mathbb{R}, \exists 1 \in \mathbb{R} \text{ such that}$$

$$a \cdot 1 = 1 \cdot a = a$$

the real number '1' is called the multiplicative identity of \mathbb{R} .

(iv) Existence of inverse:

$$\forall a \in \mathbb{R}, a \neq 0, \exists b \in \mathbb{R} \text{ such that } a \cdot b = b \cdot a = 1$$

the real number 'b' is called the multiplicative inverse of 'a' and is denoted by a^{-1} .

(v) Commutative Property:

$$\forall a, b \in \mathbb{R} \Rightarrow a \cdot b = b \cdot a$$

III. Distributivity :-

multiplication is distributive with respect to addition in \mathbb{R} .

i.e. $\forall a, b, c \in \mathbb{R}$

$$\Rightarrow a \cdot (b+c) = a \cdot b + a \cdot c \text{ (L.D.L.)}$$

and

$$(b+c) \cdot a = b \cdot a + c \cdot a \text{ (R.D.L.)}$$

\rightarrow A non-empty set S is said to be a field if it possesses the two compositions $+^n$ & \times^n and satisfied all the above axioms.

Ex:- $(\mathbb{Q}, +, \cdot)$ is a field but $(\mathbb{Z}, +, \cdot)$ & $(\mathbb{N}, +, \cdot)$ are not fields.

2. Order Axioms :-

The order relation ' $>$ ' between pairs of real numbers \mathbb{R} satisfies the following axioms:

Let $a, b, c \in \mathbb{R}$ then

O₁ : for $a, b \in \mathbb{R}$, exactly one of the following holds

(i) $a > b$ (ii) $a = b$ and

(iii) $b > a$

which is known as the law of trichotomy.

O₂ : For $a, b, c \in \mathbb{R}$;

$$a > b, b > c \Rightarrow a > c$$

which is known as the law of transitivity.

O₃ :- $\forall a, b, c \in \mathbb{R}$;

$$a > b \Rightarrow a + c > b + c$$

which is known as the monotone property for $+^n$.

O₄ : $\forall a, b, c \in \mathbb{R}$;

$$a > b \text{ and } c > 0 \Rightarrow ac > bc$$

which is known as the monotone property for \times^n .

\rightarrow A field satisfying the above properties is called an ordered field.

Hence $(\mathbb{R}, +, \cdot)$ is an ordered field.

Note : $(\mathbb{Q}, +, \cdot)$ is an ordered fi

* Some more definitions :-

\rightarrow Less than relation : For $a, b \in \mathbb{R}$

$$a < b \Leftrightarrow b > a$$

\rightarrow Two real numbers :

$a \in \mathbb{R}$ is said to be between if a and is denoted by I^+ .

→ +ve real numbers :

$a \in \mathbb{R}$ is said to be '+ve' if $a > 0$ and is denoted by \mathbb{R}^+ .

$$\therefore \mathbb{R} = \mathbb{R}^- \cup \{0\} \cup \mathbb{R}^+$$

→ If $a \in \mathbb{R}^+$ and $b \in \mathbb{R}^-$ then $a > b$.

→ A real number ' a ' is said to be greater than (or) equal to ' b ' (i.e. $a \geq b$) if either $a > b$ (or) $a = b$.

→ A real number ' a ' is said to be less than (or) equal to ' b ' (i.e. $a \leq b$) if either $a < b$ (or) $a = b$.

* → Some Properties of order relation:

→ $a \in \mathbb{R}^+ \Leftrightarrow a > 0$ and $a \in \mathbb{R}^- \Leftrightarrow a < 0$

→ $\forall a, b \in \mathbb{R}^+ \Rightarrow a+b \in \mathbb{R}^+$ and $ab \in \mathbb{R}^+$ i.e. $a > 0, b > 0$

∴ here $\Rightarrow a+b > 0$ & $ab > 0$

→ $\forall a, b \in \mathbb{R}^- \Rightarrow a+b \in \mathbb{R}^-$ and $ab \in \mathbb{R}^+$.

i.e. $a < 0, b < 0 \Rightarrow a+b < 0$ & $ab > 0$.

→ $a < b$ and $b < c \Rightarrow a < c$
(law of transitivity)

→ $a < b \Leftrightarrow a+c < b+c$ & $a < b$
and $c < 0 \Rightarrow ac > bc$.

$$\rightarrow a < 0 \Leftrightarrow -a > 0$$

$$a > 0 \Leftrightarrow -a < 0$$

$$\rightarrow a > b \Leftrightarrow (a-b) > 0$$

$$a < b \Leftrightarrow (a-b) < 0$$

$$\rightarrow a > b \Leftrightarrow -a < -b$$

$$\rightarrow a > 0 \Leftrightarrow \frac{1}{a} > 0$$

$$\rightarrow a > b > 0 \Rightarrow \frac{1}{b} > \frac{1}{a} > 0$$

$$\rightarrow a \neq 0 \Rightarrow a^2 > 0$$

$$\rightarrow a \geq b > 0 \Rightarrow a^2 > b^2$$

$$a < b < 0 \Rightarrow a^2 > b^2$$

→ the relations \geq and \leq are known as the weak inequalities and the relations $>$ and $<$ are known as the strict inequalities.

* Intervals :-

Intervals are two types:

- ① finite intervals
- ② infinite intervals.

1. Finite Intervals:

Let $a, b \in \mathbb{R}$ with $a < b$ then

(i) the set $\{x | x \in \mathbb{R}, a \leq x \leq b\}$

is called a closed interval
and is denoted by $[a, b]$,

a and b are called the end
points of the interval.

a is called the left
end point while b is called the
right end point.

Here both the end points a & b
belong to the interval.

(ii), the set $\{x | x \in \mathbb{R}; a < x < b\}$
is called an open interval
and is denoted by (a, b)
or $]a, b[$.

Here both the end points
do not belong to the interval.

(iii), the set $\{x | x \in \mathbb{R}; a \leq x < b\}$
is called left-half closed
interval (or right-half open
interval). And is denoted

by $[a, b)$ or $[a, b[$.

Here the left end point a belongs
to the interval and right end point
 b does not belong to the interval.

(iv), the set $\{x | x \in \mathbb{R}, a < x \leq b\}$ is
called right-half closed interval
(or left-half open interval) and
is denoted by $(a, b]$ or $]a, b]$.

Note: — If $a = b$

$(a, a) = \emptyset$ and $[a, a] = \{a\}$.

2. Infinite intervals:

Let $a \in \mathbb{R}$ then

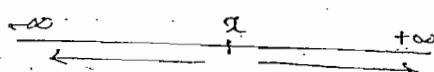

(i), the set $\{x | x \in \mathbb{R}, x \geq a\}$
i.e. $x \geq a$
is called a closed right ray and
is denoted by $[a, \infty)$.

(ii), the set $\{x | x \in \mathbb{R}, x > a\}$
is called open right ray and is
denoted by (a, ∞) .

(iii), the set $\{x | x \in \mathbb{R}, x \leq a\}$ is called
closed left-ray and is denoted
 $(-\infty, a]$.

(iv), the set $\{x | x \in \mathbb{R}, x < a\}$ is
called open left-ray and is
denoted by $(-\infty, a)$.

(v) The set $\{x | x \in \mathbb{R}\}$ is also called an interval and has no end points. It is denoted by $(-\infty, \infty)$.

→ Length of an interval :-

For each interval whose end points are any real numbers $a & b$ such that $a < b$, the length of the interval is $b-a$.

Obviously the length of each of the intervals $[a, b]$, $]a, b[$, $]a, b]$ and $[a, b[$ is $b-a$. These intervals are called finite intervals because the length of each of them is finite.

The intervals $[a, \infty[$, $]a, \infty[$, $]-\infty, a]$, $]-\infty, a[$ and $]-\infty, \infty[$ are called infinite intervals

because the length of each of them is infinite.

Note:- (i) Every interval is an infinite set but every infinite set need not be an interval.

- Ex:-
- ① \mathbb{N} is not an interval
 - ② \mathbb{Z} is not an interval
 - ③ \mathbb{Q} is not an interval
 - ④ $\mathbb{R} - \mathbb{Q}$ is not an interval
 - ⑤ \emptyset, \mathbb{R} sets are intervals.

2. A finite interval is also an infinite set because the word finite only signifies that the length of the interval is finite.

3. A ray is an infinite interval.

One System (IR):-

To extend the real number system by adjoining two "ideal points" denoted by $+\infty$ and $-\infty$. The enlarged set is called the set of extended real numbers.

Note: \mathbb{R} is denoted by $(-\infty, \infty)$ and \mathbb{R}^* by $[-\infty, \infty]$.

If $x \in \mathbb{R}$ then $-\infty < x < \infty$,

$$x + \infty = \infty + x = -x + \infty = \infty - x = \infty;$$

$$x - \infty = -\infty + x = -\infty - x = -x - \infty = -\infty;$$

$$\frac{x}{\infty} = 0;$$

$$\frac{\infty}{x} = \infty \times x = x \times \infty = \begin{cases} \infty & \text{if } x > 0 \\ -\infty & \text{if } x < 0 \end{cases}$$

$$\text{Further } \infty \times \infty = (-\infty) \times (-\infty) = \infty + \infty = \infty.$$

$$\infty \times (-\infty) = (-\infty) \times \infty = -\infty - \infty = -\infty.$$

The following combinations are meaningless.

$$\infty - \infty, -\infty + \infty, 0 \times \infty, \infty \times 0, \frac{\infty}{\infty}$$

Bounds of Set:

Lower bound of a subset of \mathbb{R} :

Let S be a non-empty subset of \mathbb{R} . If there exists a number $m \in \mathbb{R}$ such that

$m \leq x$ for all $x \in S$ then m is called a lower bound of S .

$$\text{Ex: (i) } N = \{1, 2, 3, \dots\} \subseteq \mathbb{R}$$

$$1 \leq x \forall x \in N.$$

$\therefore 1$ is called the lower bound of N .

$$\text{(ii) The set } S = \{0, 1, 2, 3, \dots\} \subseteq \mathbb{R}$$

$$0 \leq x \forall x \in S$$

$\therefore 0$ is the lower bound.

Bounded below set:

A non-empty subset S of \mathbb{R} (i.e., $S \subseteq \mathbb{R}$) is said to be bounded below if it has lower bound.

$$\text{Ex: (i) } S = \{1, 2, 3, 4, \dots\} \subseteq \mathbb{R}$$

is bounded below.

Since 1 is lower bound.

$$(ii) \mathbb{R}^+ = \{x/x > 0\} = (0, \infty)$$

is bounded below.

Since 0 is lower bound & of

$$(iii) S = \{x/x \geq 0\} = [0, \infty) \text{ is bounded below.}$$

Since 0 is lower bound & of

note: 0 is lower bound of S .

every real number smaller than 0 is also a lower bound of S .

i.e., if a set S is bounded below then the set of all such

bounds of S is infinite.

Greatest lower bound (glb) or infimum:

Let S be a non-empty subset of \mathbb{R} . If a set $'S'$ is bounded below and if the set of all lower bounds of S has a greatest member, say t then t is called greatest lower bound or infimum of S .

(Or)

If t is a lower bound of S and any real number greater than t is not lower bound of S then t is called the greatest lower bound or infimum of S .

(Or)

If S is bounded below, then a number t is said to be greatest lower bound or infimum of S if it satisfies the conditions

1. t is lower bound of S and
2. if w is any lower bound of S then $w \leq t$.

$$0 < 1, 2, 3 \dots \in \mathbb{N}$$

Since $-1 < x \forall x \in S$

-1 is lower bound of S but -1 is not greatest lower bound of S .

Since $0 < x \forall x \in S$

0 is a lower bound of S but 0 is not greatest lower bound of S .

Since $0.9 < x \forall x \in S$

0.9 is a lower bound of S but 0.9 is not greatest lower bound of S .

1 is a lower bound of S and is greatest lower bound of S .

because, the greatest of all lower bounds of S is 1 .

Note :- If t is infimum of S then for each $\epsilon > 0$ (however small), the number $t + \epsilon$ is not a lower bound of S , there exists atleast one member $x \in S$ such that $t \leq x < t + \epsilon$.

Upper bound :- Let S be a non-empty subset of \mathbb{R} . If there exists a number $M \in \mathbb{R}$ such that

$x \leq v \forall x \in S$ then v is called an upper bound of S .

Ex:- $S = \{-3, -2, -1\} \subseteq \mathbb{R}$
 $x \leq -1 \forall x \in S$

$\therefore -1$ is called the upper bound of S .

Bounded above set

A non-empty subset S of \mathbb{R} (i.e. $S \subseteq \mathbb{R}$) is said to be bounded above if it has an upper bound.

Ex:- (1) $\mathbb{R} = \{x \in \mathbb{R} : x < 0\} = (-\infty, 0)$
is bounded above

Since 0 is an upper bound and $0 \notin \mathbb{R}$

(2). $S = \{x \in \mathbb{R} : x \leq 0\} = (-\infty, 0]$ is bounded above.

Since 0 is an upper bound and $0 \in S$.

Note:- If v is an upper bound of a set S then every real number greater than v is also an upper bound of S . i.e. if a set S is bounded above then set of all such numbers that are upper bounds of S is infinite.

Least upper bound

Supremum

Let S be a non-empty subset of \mathbb{R} . If a set S is bounded above and if the set of all upper bounds of S has a least member say t_1 then t_1 is called least upper bound (or) supremum of S .

(or)

If t_1 is an upper bound of S & any real number less than t_1 is not an upper bound of S then t_1 is called least upper bound (or) supre of S .

(or)

If S is bounded above then a number t_1 is said to be least upper bound supremum of S if it satisfies the following conditions.

- (1) t_1 is an upper bound of S and
- (2) If w_1 is any upper bound of S , then $t_1 \leq w_1$.

Ex:- $S = \{ \dots, 48, 49, 50 \} \subseteq \mathbb{R}$

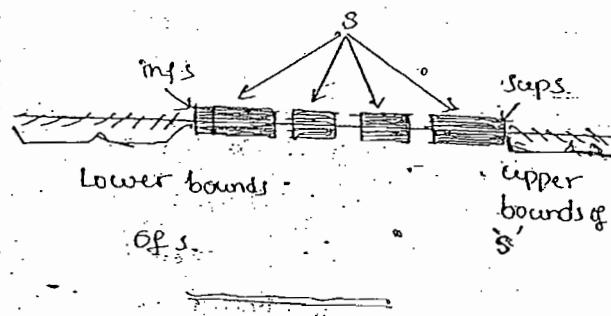

Since $x < 51 \forall x \in S$

$\therefore 51$ is an upper bound of S but is not supremum of S .

Since $x < 50.5 \forall x \in S$

$\therefore 50.5$ is an upper bound of S but is not supremum of S .

Note:— If t_i is supremum of s then for each $\epsilon > 0$ (however small), the number $t_i - \epsilon$ is not an upper bound of s , there exists at least one member $x \in s$ such that $t_i - \epsilon < x \leq t_i$.

→ Find the infimum & supremum of the following sets and also find whether they belong to set or not.

(1) $S = \{3, 4, 7\} \subseteq \mathbb{R}$
 $\inf s = 3 \in s$; $\sup s = 7 \in s$

(2) $S = \{\frac{n}{n+1} | n \in \mathbb{N}\} = \{\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \dots\} \subseteq \mathbb{R}$

since $n \in \mathbb{N}; n > 0$

$$\Rightarrow 0 < \frac{1}{n} \leq 1 \quad \forall n \in \mathbb{N}$$

$$\Rightarrow 0 < \frac{n}{n+1} \leq 1 \quad \forall n \in \mathbb{N}$$

$$\therefore \inf s = 0 \notin s$$

$$\sup s = 1 \in s$$

(3) $S = \{-k_n | n \in \mathbb{N}\} = \{-1, -k_2, -k_3, -k_4, \dots\} \subseteq \mathbb{R}$
 since $n \in \mathbb{N}; n > 0$

$$\Rightarrow 0 < \frac{1}{n} \leq 1$$

$$\Rightarrow -1 \leq -k_n < 0$$

$$\therefore \inf = -k \in s \text{ & } \sup = 0 \notin s$$

(4) $S = \{\frac{1}{3^n} | n \in \mathbb{N}\} = \{\frac{1}{3}, \frac{1}{3^2}, \frac{1}{3^3}, \dots\}$

$$\sup = \frac{1}{3} \in s, \inf = 0 \notin s$$

(5) $S = \{\frac{(-1)^n}{n} | n \in \mathbb{N}\}$

$$= \left\{ -1, \frac{1}{2}, -\frac{1}{3}, \frac{1}{4}, -\frac{1}{5}, \dots \right\}$$

$$= \left\{ -1, -\frac{1}{3}, -\frac{1}{5}, \dots, \frac{1}{2}, \frac{1}{4}, \dots \right\}$$

$$\inf = -1 \in s; \sup = \frac{1}{2} \in s$$

(6) $S = \{a + \frac{1}{n} | n \in \mathbb{N}\} = \{a+1, a+\frac{1}{2}, \dots\}$

since $n \in \mathbb{N}, n > 0$

$$\Rightarrow 0 < \frac{1}{n} \leq 1$$

$$\Rightarrow a < a + \frac{1}{n} \leq a+1$$

$$\therefore \inf = a \notin s; \sup = a+1 \in s$$

(7) $S = \{1\}$

$$\inf = \sup = 1 \in s$$

(8) $S = \{\frac{3n+2}{2n+1} | n \in \mathbb{N}\} \subseteq \mathbb{R}$

$$= \left\{ \frac{5}{3}, \frac{8}{5}, \dots \right\}$$

$$\sup = \frac{5}{3} \in s; \inf = 1 \in s$$

$$= \frac{3}{2} \notin s$$

(9) $S = \{y_{5^n} | n \in \mathbb{Z}; n \neq 0\}$

$$= \left\{ \pm y_5, \pm y_{10}, \pm y_{15}, \dots \right\}$$

$$\inf = -y_5 \in s; \sup = y_5 \in s$$

$$\textcircled{10} \quad S = \{2^n | n \in \mathbb{N}\} = \{2^1, 2^2, 2^3, \dots\}$$

$$\inf_{n \rightarrow \infty} S = 2 \in S; \sup_{n \rightarrow \infty} S = \lim_{n \rightarrow \infty} 2^n = \infty.$$

Ans: $\inf S$ & $\sup S$ does not exist.

$$\textcircled{11} \quad S = \{1 - \frac{1}{n} | n \in \mathbb{N}\}$$

$$\textcircled{12} \quad S = \{x | -5 \leq x \leq 3\}$$

$$\textcircled{13} \quad S = \{x | x = (-1)^n; n \in \mathbb{N}\}$$

$$\textcircled{14} \quad S = \{x | x = (-1)^n \cdot n; n \in \mathbb{N}\}$$

$$= \{-1, 2, -3, 4, -5, 6, -7, \dots\}$$

$$= \{-1, -3, -5, \dots; 2, 4, 6, \dots\}$$

$\therefore \inf S$ does not exist, &

$\sup S$ does not exist.

* Bounded Subset S of real Numbers:

i.e. A subset S of \mathbb{R} is said to be bdd if it is bdd below as well as bdd above.

i.e. A set S is bdd iff there exist two real numbers u, v such that $u \leq x \leq v \forall x \in S$.

i.e. $x \in [u, v] \forall x \in S$

i.e. $S \subseteq [u, v]$

i.e. S is a subset of $[u, v]$.

Ex:- (i) Every finite set is bdd and it has inf & sup.

(ii) $\inf \emptyset = \infty$ & $\sup \emptyset = -\infty$
 $\therefore \inf \& \sup \text{ of } \emptyset \text{ does not exist}$

Because:

The null set \emptyset is bdd above if u is any real number then u is an upper bound for \emptyset obviously condition $x \leq u$ for all $x \in \emptyset$ is vacuously satisfied because \emptyset has no elements.

thus every real number is an upper bound for \emptyset . Since the set of all real numbers has no smallest member.

$\therefore \sup \emptyset$ does not exist

Similarly $\inf \emptyset$ does not exist.

(3). $\mathbb{N} = \{1, 2, 3, \dots\}$ is bdd below but not bdd above.

(4). $\mathbb{R}^+ = \{x \in \mathbb{R} | x > 0\}$ is bdd below but not bdd above.

(5). $\mathbb{R}^- = \{x \in \mathbb{R} | x < 0\}$ is bdd above but not bdd below.

* Greatest & Least members of a subset of \mathbb{R} :

If the supremum of a subset S of \mathbb{R} is a member of S .

i.e. S attains its supremum then this supremum is called greatest

→ If the inf of a subset 's' of IR is a member of 's' (i.e. 's' attains its infimum) then this infimum is least member of 's'.

→ Ex :- (1) $s = [2, 3]$

$$\text{i.e. } s = \{x \mid 2 \leq x < 3\}$$

$$\sup s = 3 \notin s \text{ & } \inf s = 2 \notin s.$$

∴ 3 is not greatest member & 2 is not least member.

(2) $s = [2, 3]$

$$\text{i.e. } s = \{x \mid 2 \leq x \leq 3\}$$

(3). $s = [1, 2)$ i.e. $s = \{x \mid 1 \leq x < 2\}$

(4). $s = (1, 2]$ i.e. $s = \{x \mid 1 < x \leq 2\}$

(5). The unbounded intervals are

$[a, \infty)$, $(a, \infty]$,

$[-\infty, a]$, $(-\infty, a]$, $[-\infty, \infty]$.

Now suppose

$$s = [a, \infty) = \{x \mid x \geq a\}$$

$\inf s = a \in s$ & $\sup s$ does not exist.

∴ least member of $s = a$.

* Note :- (1). Every finite set has two bounds

(2) Every infinite set may or may not have bounds.

may or may not belong to the set.

(1). Supremum & infimum of a bounded set need not belong to the set.

(2). Every greatest member of a set 's' is the supremum of 's' but every sup. of 's' need not be the greatest member of 's'.

(3). Every least member of a set 's' is the infimum of 's' but every inf. of 's' need not be the least member of 's'.

* Completeness Property of IR

(Or Completeness Axiom):

Every non-empty set of real numbers has a least upper bound.

or Every non-empty set of real numbers has a smallest upper bound.

i.e. If 's' is any non-empty subset of IR which is bounded above, then the set of all upper bounds of 's' must have smallest member i.e. $\$$ must possess the least upper bound which is a member of IR.

This property of real numbers is known as completeness.
(This property is also called the supremum property of \mathbb{R}).
(or)

→ Every non-empty subset of real numbers which is bounded below has the infimum (or glb) in \mathbb{R} . This property of real numbers is known as completeness. This property is also called infimum property of \mathbb{R} .

* Complete Ordered Field

An ordered field F is said to be a complete ordered field if every non-empty subset S of F (i.e. $S \subseteq F$) which is bounded above has the supremum (or least upper bound) in F .

Ex:- The set \mathbb{R} of real numbers is complete ordered field.

Because \mathbb{R} satisfies

① field axioms

② order axioms and

(iii) completeness axiom.
Ex:- (2). The set \mathbb{Q} of rational numbers is an ordered field but not completeness.

→ Now we shall show that the ordered field of rational numbers is not a complete ordered field.

for this we are enc to show that there exists a non-empty subset of \mathbb{Q} which bounded above but which does not have a supremum in \mathbb{Q} .

i.e. no rational number exists which can be the supremum.

Let us consider the set of all those irrational numbers whose squares are less than i.e. let $S = \{x : x \in \mathbb{Q} \text{ and } x^2 < 2\}$ and $a \in S$
since $1 \in S$ $\frac{a+1}{2} \in S$
 $\therefore S \neq \{\}$

i.e. S is non-empty.

clearly 2 is an upper bound of S .

$\therefore S$ is bounded above.

$\therefore S$ is a non-empty subset of \mathbb{Q} and is bounded above.

It is possible suppose that in rational number k be its least upper bound.

Clearly k is +ve.

By law of trichotomy, which holds good in \mathbb{Q} one and only one of (i) $k^2 < 2$ (ii) $k^2 = 2$ (iii) $k^2 > 2$ holds.

(i) $k^2 < 2$

Let us consider the +ve rational number - $y = \frac{4+3k}{3+2k}$

$$\text{then } k-y = k - \left(\frac{4+3k}{3+2k} \right)$$

$S = \{x \mid \text{new}\}$

$$= \{x \mid \text{real, } 0 < x \leq 1\} \subset S$$

$2 < k^2 < y^2 \text{ (i.e. } k^2 < 0 \text{)}$ ($\because k^2 < 2$)

$$\text{Also } 2-y^2 = 2 - \left(\frac{4+3k}{3+2k} \right)^2$$

$$= \frac{2-k^2}{(3+2k)^2}$$

$$> 0 \quad (\because k^2 < 2 \text{ i.e. } 2-k^2 > 0)$$

$$\therefore 2-y^2 > 0$$

$$\Rightarrow y^2 < 2$$

$\Rightarrow \boxed{\text{yes}}$

\therefore The member y of S is greater than k so that k cannot be an

upper bound.

(ii) $k^2 = 2$, we know that there exists no rational number whose square is equal to 2.

\therefore This case is not possible.

(iii) $k^2 > 2$

let us consider the +ve rational number:

$$y = \frac{4+3k}{3+2k} \quad (> 0)$$

$$\text{then } k-y = k - \left(\frac{4+3k}{3+2k} \right)$$

$$= \frac{2(k^2-2)}{3+2k}$$

$$> 0 \quad (\because k^2 > 2)$$

$$\Rightarrow k^2-2 > 0$$

$$\therefore k-y > 0$$

$$\Rightarrow \boxed{k > y}$$

$$\text{Also } 2-y^2 = 2 - \left(\frac{4+3k}{3+2k} \right)^2$$

$$= \frac{2-k^2}{(3+2k)^2} < 0$$

$$\therefore 2-y^2 < 0 \quad (\because 2-k^2 < 0)$$

$$\Rightarrow 2 < y^2$$

$$\Rightarrow \boxed{y^2 > 2}$$

$$\therefore y < k \text{ & } y^2 > 2 \Rightarrow y^2 < k^2 \text{ & } y^2 > 2$$

$$\Rightarrow 2 < y^2 < k^2$$

If x is any member of S then

$$0 < x^2 < 2 < y^2 < k^2$$

$$\Rightarrow 0 < x^2 < y < k$$

which shows x & y are own upper bounds of S .

But $y < k$

$\therefore k$ cannot be the supremum.

\because since k is any rational number, we conclude that no rational number can be the supremum of S .

* The Archimedean Property:

If $a \& b$ be any two real numbers and if $a > 0$, then there exists a +ve integer n such that $na > b$.

Proof :- Let $a \& b$ be any two real numbers and $a > 0$.

Now if possible suppose that for all +ve integers n ,

i.e. $na \leq b$.

Let $S = \{na \mid n \in \mathbb{N}\}$: then S is bounded above by b (i.e. b is an upper bound of S).

\therefore By Completeness Property of the ordered field of real numbers, the set S must have a supremum M (say)

$$\therefore a \leq M \quad \forall n \in \mathbb{N}^+$$

$$\Rightarrow (M-a) \cdot n \geq 0$$

$$\Rightarrow na \leq M-a \quad \forall n \in \mathbb{N}^+$$

$\therefore M-a$ is an upper bound of S .

The number $M-a$ is less than

Supremum M (least upper bound) is an upper bound of S .

\therefore which is a contradiction.

\therefore Our supposition is wrong.
Hence theorem.

* Absolute Value (modulus of a real number):

If $x \in \mathbb{R}$ then the modulus

or absolute value or numerical

value of x is denoted by $|x|$ and

defined as $|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$

Properties:

Prove that (i) $|x| = \max\{x, -x\}$

(ii) $|x|^2 = x^2$ (iii) $x \leq |x|$ and $-x \leq |x|$

(iv) $|x| = |-x|$.

Proof :- (i) Since $x \in \mathbb{R}$, either $x \geq 0$ or $x < 0$.

If $x \geq 0$ then $|x| = x$ and $x \geq -x$

and if $x < 0$, then $|x| = -x$ and $-x > x$.

$\therefore |x|$ is greater of two numbers x & $-x$.

$$\therefore |x| = \max\{x, -x\}$$

(ii) Since $|x| = x$ if $x \geq 0$
 $= -x$ if $x < 0$

$$\therefore |x|^2 = x^2 \text{ (or)} (-x)^2$$

$$= x^2$$

$$\boxed{|x|^2 = x^2}$$

(iii) Since $|x| = \max\{x, -x\}$

$$\therefore |x| \geq x \text{ or } -x$$

$$\therefore x \leq |x| \text{ and } -x \leq |x|.$$

(iv) Since $|x| = \max\{x, -x\}$
and $|-x| = \max\{-x, x\} = \max\{x, -x\}$

$$\therefore |x| = |-x|$$

Note: $|x|^2 = x^2$

$$\Rightarrow |x| = \pm \sqrt{x^2}$$

Since $|x| \geq 0$.

∴ rejecting the -ve sign,
we have $\boxed{|x| = \sqrt{x^2}}$

(v) $|x| = \sqrt{x^2}$

and $|-x| = \sqrt{(-x)^2}$

$$= \sqrt{x^2}$$

∴ $|x| = \sqrt{x^2}$

$$\therefore \boxed{|x| = |-x|}$$

→ If x & y are any two real numbers

then (a) $|x+y| \leq (|x|+|y|)$

(b) $|x-y| \geq (|x|-|y|)$

(c) $|xy| = |x||y|$

(d) $\left|\frac{x}{y}\right| = \frac{|x|}{|y|}$ if $y \neq 0$.

(a) $|x+y| = \sqrt{(x+y)^2}$

$$= \sqrt{x^2+y^2+2xy}$$

$$\leq \sqrt{x^2+y^2+2|x||y|}$$

$$= \sqrt{|x|^2+|y|^2+2|x||y|}$$

$$= \sqrt{[|x|+|y|]^2}$$

$$= |x|+|y| \quad (\because |x|=|x|)$$

$$= |x|+|y| \quad (\because |x|+|y| \geq 0)$$

$$\therefore \boxed{|x+y| \leq (|x|+|y|)}$$

(b) $|x-y| = \sqrt{(x-y)^2}$

$$= \sqrt{x^2+y^2-2xy}$$

$$\geq \sqrt{x^2+y^2-2|x||y|}$$

$$(\because x \leq |x| \text{ & } y \leq |y|)$$

$$\Rightarrow xy \leq |x||y|$$

$$\Rightarrow -xy \geq -|x||y|$$

$$= \sqrt{|x|^2+|y|^2-2|x||y|}$$

$$= \sqrt{(|x|-|y|)^2}$$

$$= |x|-|y| \quad (\because |x| \geq |y|)$$

$$\therefore \boxed{|x-y| \geq (|x|-|y|)}$$

(c) $|xy| = \sqrt{(xy)^2}$

$$= \sqrt{x^2y^2}$$

$$= \sqrt{x^2} \cdot \sqrt{y^2}$$

$$= |x||y|.$$

(d) $\left|\frac{x}{y}\right| = \sqrt{\left(\frac{x}{y}\right)^2}$

$$= \frac{\sqrt{x^2}}{\sqrt{y^2}} = \frac{|x|}{|y|} \quad \text{provided } y \neq 0.$$

→ If $\delta > 0$ then Prove that

$$(a) |x| < \delta \Leftrightarrow -\delta < x < \delta$$

$$(b) |x-a| < \delta \Leftrightarrow a-\delta < x < a+\delta$$

$$\text{Soln: } (a) |x| < \delta \Leftrightarrow \max\{|x|, -x\} < \delta$$

$$\Leftrightarrow x < \delta \text{ and } -x < \delta$$

$$\Leftrightarrow x < \delta \text{ and } x > -\delta$$

$$\Leftrightarrow -\delta < x < \delta$$

$$\Leftrightarrow -\delta < x < \delta$$

$$(b) |x-a| < \delta \Leftrightarrow \max\{|x-a|, -(x-a)\} < \delta$$

$$\Leftrightarrow x-a < \delta \text{ and } -(x-a) < \delta$$

$$\Leftrightarrow x < a+\delta \text{ and } x > a-\delta$$

$$\Leftrightarrow a-\delta < x < a+\delta$$

$$\Leftrightarrow a-\delta < x < a+\delta$$

→ Prove that (i) $|x+y| \leq |x| + |y|$

$$(ii) a < x \leq b \Leftrightarrow |x - \left(\frac{a+b}{2}\right)| < \frac{b-a}{2}$$

Proof: (i) $|x+y| = |x+(y)|$

$$\leq |x| + |y|$$

$$= |x| + |y|$$

$$(\because |y| = |y|)$$

$$\therefore |x+y| \leq |x| + |y|.$$

(ii) $a < x < b$

Adding throughout $-\left(\frac{a+b}{2}\right)$,

we get

$$\Leftrightarrow a - \left(\frac{a+b}{2}\right) < x - \left(\frac{a+b}{2}\right) < b - \left(\frac{a+b}{2}\right)$$

$$\Leftrightarrow \frac{a-\delta}{2} < x - \left(\frac{a+b}{2}\right) < \frac{b-\delta}{2}$$

$$\Leftrightarrow -\left(\frac{b-a}{2}\right) < x - \left(\frac{a+b}{2}\right) < \left(\frac{b-a}{2}\right)$$

$$\Leftrightarrow \left|x - \left(\frac{a+b}{2}\right)\right| < \frac{b-a}{2}$$

$$(\because |x| < \delta \Leftrightarrow -\delta < x < \delta)$$

* Neighbourhood of a point:

If a is any real number and $\delta > 0$ (however small), then the open interval $(a-\delta, a+\delta)$ is called a δ -neighbourhood of a and is denoted by $N_\delta(a)$ or

$N(\delta, a)$, i.e. $N_\delta(a) = (a-\delta, a+\delta)$

shortly written as $\text{neighborhood of } a$.

$\therefore x \in (a-\delta, a+\delta)$

\rightarrow If from the neighbourhood of a point, the point itself is excluded we get the deleted neighbourhood of that point, i.e.,

i.e. $N_\delta(a) - \{a\}$ is a deleted neighbourhood of a point a and is denoted by $N_{\delta d}(a)$

i.e. $N_{\delta d}(a) = N_\delta(a) - \{a\}$

Ex:- If $a = 5$, $\delta = 0.2 > 0$, then

$(4.8, 5.2)$ is a neighbourhood of a .

Now $x \in (4.8, 5.2) - \{5\} \Rightarrow x \in (4.8, 5)$
 $x \neq 5$ is a deleted

Note:- $x \in N_\delta(a)$

$$\Leftrightarrow x \in (a-\delta, a+\delta)$$

$$\Leftrightarrow a-\delta < x < a+\delta$$

$$\Leftrightarrow -\delta < x-a < \delta$$

$$\Leftrightarrow |x-a| < \delta$$

$$(\forall \epsilon > 0 \Leftrightarrow -\epsilon < x < \epsilon)$$

and $x \in N_\delta(a)^\circ$

$$\Leftrightarrow x \in (a-\delta, a+\delta) - \{a\}$$

$$\Leftrightarrow x \in (a-\delta, a+\delta); x \neq a$$

$$\Leftrightarrow a-\delta < x < a+\delta; x \neq a$$

$$\Leftrightarrow |x-a| < \delta; x \neq a$$

$$\Leftrightarrow 0 < |x-a| < \delta$$

* Neighbourhood of a set S

\rightarrow A subset S of \mathbb{R} (i.e. $S \subseteq \mathbb{R}$) is said to be neighbourhood of a point $a \in S$ if there exists a $\delta > 0$

(however small) such that

$$(a-\delta, a+\delta) \subseteq S$$

Note:- If S is a neighbourhood of a point a , then $S - \{a\}$ is called deleted neighbourhood of a .

Ex:- (1) If $a \in \mathbb{R} \subseteq \mathbb{R}$ then \mathbb{R} is a neighbourhood of a because $a \in (a-\delta, a+\delta) \subseteq \mathbb{R}$.

(2) If $a \in \mathbb{Q} \subseteq \mathbb{R}$ then \mathbb{Q} is not neighbourhood of a because $a \in (a-\delta, a+\delta) \notin \mathbb{Q}$.

neighbourhood of a'

because $a' \in (a-\delta, a+\delta) \notin \mathbb{Z}$

(3). If $a \in \mathbb{C} \setminus \{a\}$ then \mathbb{C} is not neighbourhood of a because $a \in (a-\delta, a+\delta) \notin \mathbb{C}$.

Problems

\rightarrow Any open interval is a neighbourhood of each of its points.

Sol'n :- Let $S = (a, b)$

Let P be any point of (a, b)

i.e. $P \in (a, b)$

$$\Rightarrow a < P < b$$

$$\Rightarrow \epsilon = \min\{P-a, b-P\} > 0$$

$$\Rightarrow \epsilon \leq P-a; \epsilon \leq b-P$$

$$\Rightarrow a \leq P-\epsilon; b \geq P+\epsilon$$

$$\Rightarrow a \leq P-\epsilon < P < P+\epsilon \leq b$$

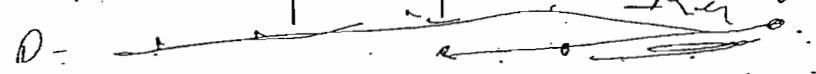

$$\Rightarrow P \in (P-\epsilon, P+\epsilon) \subset (a, b)$$

$\therefore (a, b)$ is a neighbourhood of P .

\rightarrow A closed interval $[a, b]$ is a neighbourhood of each of its points except the two end points a & b .

Sol'n :- Let $S = [a, b]$

Let $P \in [a, b]$

$$\Rightarrow a \leq p \leq b$$

$$\Rightarrow (i) a < p < b$$

$$(ii), p = a \text{ &}$$

$$(iii), p = b$$

$$\text{Let } \epsilon = \min \{p-a, b-p\} > 0.$$

$$i) p \in (p-\epsilon, p+\epsilon) \subset (a, b) \subset [a, b]$$

$$\therefore p \in (p-\epsilon, p+\epsilon) \subset [a, b]$$

$\therefore [a, b]$ is a neighbourhood of p .

i.e. $[a, b]$ is a neighbourhood of each $p \in [a, b]$.

$$ii), p = a$$

$$\Rightarrow (p-\epsilon, p+\epsilon) = (a-\epsilon, a+\epsilon) \not\subset [a, b]$$

$[a, b]$ is not neighbourhood of a .

$$iii), p = b$$

$$\Rightarrow (p-\epsilon, p+\epsilon) = (b-\epsilon, b+\epsilon) \not\subset [a, b]$$

$[a, b]$ is not neighbourhood of b .

$[a, b]$ is a neighbourhood of each of its points except a

$\rightarrow [a, b]$ is a neighbourhood of each of its points except each.

\rightarrow A non-empty finite set can't be a neighbourhood any of its points.

Sol'n - Let s be any non-empty finite set.

Let p be any point of s .

Let $\epsilon > 0$ (however small)

then $(p-\epsilon, p+\epsilon)$ is an infinit

set.

$$(p-\epsilon, p+\epsilon) \not\subset s$$

$\therefore s$ is not a neighbourhood of any.

\rightarrow Empty set ϕ is a neighbourhood of each of its points.

Sol'n - The empty set ϕ is a

neighbourhood of each of its poi

because there is no point at all in ϕ .

and so there is no point in ϕ which it is not a neighbourhood.

\rightarrow Show that the set 'N' of all natural is not a neighbourhood of any of its points.

Sol'n - Let $p \in N$ and let $\epsilon > 0$.

then $(P-\epsilon, P+\epsilon)$ contains infinitely many rational and irrational numbers.

$$\therefore (P-\epsilon, P+\epsilon) \notin N$$

$\therefore N$ is not a neighbourhood of any point $P \in N$.

Similarly, the set 'w' of all whole numbers is not a neighbourhood of any of its points.

- And the set 'I' of integers is not a neighbourhood of any of its points.

→ Show that the set Q of all rational numbers is not a neighbourhood of any of its points.

Sol: Let $P \in Q$ and let $\epsilon > 0$.
 $\exists n \in \mathbb{N}$ (however small)

then $(P-\epsilon, P+\epsilon)$ contains infinitely many irrational numbers which are not members of Q .

$$\therefore (P-\epsilon, P+\epsilon) \notin Q$$

$\therefore Q$ is not a neighbourhood of any point $P \in Q$.

Similarly, the set \mathbb{Q}' of all irrational numbers is not a neighbourhood of any of its points.

is a nbd of each of its points.

Sol: Let $P \in \mathbb{R}$ and let $\epsilon > 0$.

then $(P-\epsilon, P+\epsilon)$ contains infinitely many real numbers $P \in (P-\epsilon, P+\epsilon) \subset \mathbb{R}$

\therefore the set \mathbb{R} of real numbers is a nbd of its points.

→ Any set 'S' cannot be a nbd of any point of the set $\mathbb{R} - S$.

Sol: Let $P \in \mathbb{R} - S$

then $P \notin S$.

let $\epsilon > 0$.

$$\Rightarrow (P-\epsilon, P+\epsilon) \notin S$$

$\therefore S$ is not a nbd of any point $P \in \mathbb{R} - S$.

→ Every superset of nbd of a point 'P' is also nbd of P.

Sol: Let S be a nbd of P .

$$\Rightarrow (P-\epsilon, P+\epsilon) \subset S$$

If T is any superset of S , then $S \subset T$.

$$(P-\epsilon, P+\epsilon) \subset S \subset T$$

$$\Rightarrow (P-\epsilon, P+\epsilon) \subset T$$

$\therefore T$ is a nbd of P .

→ The intersection of two nbds of a point is also a nbd of that point.

Sol: Let M_1 and M_2 be two nbds of P .

∴ If ϵ_1 and $\epsilon_2 > 0$ (however small) such that

$$P \in (P - \epsilon_1, P + \epsilon_1) \subset M_1 \text{ and } P \in (P - \epsilon_2, P + \epsilon_2) \subset M_2$$

$$\text{Let } \epsilon = \min\{\epsilon_1, \epsilon_2\}$$

$$(P - \epsilon, P + \epsilon) \subset (P - \epsilon_1, P + \epsilon_1) \subset M_1$$

$$\text{and } (P - \epsilon, P + \epsilon) \subset (P - \epsilon_2, P + \epsilon_2) \subset M_2$$

$$\therefore P \in (P - \epsilon, P + \epsilon) \subset M_1 \cap M_2$$

∴ $M_1 \cap M_2$ is also a nbd of P .

→ If M_1 is a nbd of P or M_2 is a nbd of P

then $M_1 \cup M_2$ is also a nbd of P .

Interior point of a set

Let $S \subset R$, $P \in S$ is called an interior point of a set S if S is a nbd of P .

i.e. if $\epsilon > 0$ (however small) such that

$$(P - \epsilon, P + \epsilon) \subset S$$

Ex: (1) Every point of an open interval (a, b) is an interior point of the interval.

(2) Every point of a closed interval $[a, b]$ is an interior point of the interval except the end points a and b .

(3) Every point of a semi-closed interval $[a, b)$ is an interior point of the interval.

except the left end point 'a'.

→ Every point of a semi open interval $(a, b]$

is an interior point of the interval except

the right end point 'b'.

→ Every point of the empty set is an interior point.

→ Every non-empty finite set has no interior

point.

→ \mathbb{N} has no interior point.

Similarly $\mathbb{W}, \mathbb{Z}, \mathbb{Q}, \mathbb{R} - \mathbb{Q}$.

→ Every point of a real number set is an interior point of \mathbb{R} .

Interior of a set:

- The set of all interior points of a set ' S ' is called interior of a set ' S ' and is denoted by S° (or) $\text{int}(S)$.

(1) If $S = (a, b)$ then $S^\circ = S$ because every point of S° is an interior point of S .

(2) If $S = [a, b]$ then $S^\circ = (a, b)$ because every point of S° is an interior point of S except the end points 'a' & 'b'.

(3) If $S = [a, b)$ then $S^\circ = (a, b)$.

(4) If $S = (a, b]$ then $S^\circ = (a, b)$.

(5) $\mathbb{R}^\circ = \mathbb{R}$ because every point of \mathbb{R} is an interior point.

(6) If S is a non-empty finite set then $S^\circ = \emptyset$.

(7) $\mathbb{N}^\circ = \emptyset, \mathbb{Z}^\circ = \emptyset, \mathbb{Q}^\circ = \emptyset, (\mathbb{R} - \mathbb{Q})^\circ = \emptyset$ & $\mathbb{W}^\circ = \emptyset$.

because $\mathbb{N}, \mathbb{Z}, \mathbb{Q}, \mathbb{R} - \mathbb{Q}, \mathbb{W}$ are not nbd of any points and therefore, no point is an interior point of $\mathbb{N}, \mathbb{Z}, \mathbb{Q}, \mathbb{R} - \mathbb{Q}$ or \mathbb{W} .

(8) If $S = \emptyset$ then $S^\circ = \emptyset$.

→ Find the interior of in ()
(i) $\{1, 2, 3, 4, 5\}$ (ii) $[0, 1]$ (iii) $[0, 1] \cup [3, 5]$ (iv) $\{\frac{1}{n} / n \in \mathbb{N}\}$

Sol: (i) Let $A = \{1, 2, 3, 4, 5\}$.

then A is a non-empty finite set.

⇒ A is not abd of any point.

∴ no point is an interior point of A .

$$\Rightarrow A^0 = \emptyset.$$

(ii). Let $A = [0, 1] \cup [3, 5]$.

then A is abd of each point of $(0, 1) \cup (3, 5)$.

$$\therefore A^0 = (0, 1) \cup (3, 5).$$

(iv) Let $A = \{\frac{1}{n} / n \in \mathbb{N}\}$

$$= \{1, \frac{1}{2}, \frac{1}{3}, \dots\}$$

Let p be any point of A ,

i.e., $p \in A$,

then there is no $\delta > 0$ such that

$(p - \delta, p + \delta) \subset A$.

⇒ p is not an interior point of A .

∴ A has no interior point

$$\therefore A^0 = \emptyset.$$

open set: A subset S of \mathbb{R} is said to be an open set if S is a nbd of each of its points i.e., if for each $p \in S$ there is an $\epsilon > 0$ such that $(p-\epsilon, p+\epsilon) \subset S$.

(or)
If 'S' is a subset of \mathbb{R} is said to be open if every point of S is an interior point of S . i.e., S is open $\Leftrightarrow S^o = S$.

Ex: (1) Every open interval is an open set.

Soln: Let $S = (a, b)$

$$\text{then } S^o = (a, b)$$

$$\therefore S^o = S$$

$\Rightarrow S$ is open set

(2) $S = [a, b]$, then $S^o = (a, b)$.

$\because S \neq S^o$
 $\Rightarrow S$ is not an open set.

Similarly $[a, b]$, $(a, b]$ are not open sets.

(3) $S = \mathbb{N}$, then $S^o = \emptyset$.

$$\therefore S \neq S^o$$

$\Rightarrow S$ is not open set.

Similarly $\mathbb{W}, \mathbb{Z}, \mathbb{Q}$ and $\mathbb{R} - \overline{\mathbb{Q}}$ are not open sets.

(4) $S = \mathbb{R}$, then $S^o = \mathbb{R}$.

$$\therefore S = S^o$$

$\Rightarrow S$ is open.

(5) $S = \mathbb{R}^+ = (0, \infty)$ is an open set.

because let $x \in S$

\exists an $\epsilon > 0$ (however small) such

$\forall x \in (x_0 - \epsilon, x_0 + \epsilon) \cup$

$$\therefore \zeta = \zeta^0.$$

(6) $S = \mathbb{R}^+ = (0, \infty)$ is an open set.

(7) Every non-empty-finite set is not an open set.

• because for every neighborhood of a point contains infinitely many points.

(8) $S = \{q\}$ is an open set.

because $S^0 = \emptyset$

(Q) $S = \{ \frac{1}{n} \mid n \in \mathbb{N} \}$ is not an open set.

Single S + S

Definition: $\mathcal{O} = \{O_1, O_2, \dots, O_n\}$ is an open set if it is a union of two open sets.

-union of two open sets

Sol: Let S_1 and S_2 be sets. Then $S = S_1 \cup S_2$

Let $x \in S \Rightarrow x \in S_{1,0,1}$

or less or less all

If x_0 is a solution of $\varphi > 0$ such that $\varphi'(x_0) = 0$, then $\varphi''(x_0)$ is open.

If $x \in \text{then } x \in S_2$ such that
 $x = f^{-1}(S_2) \subseteq S_2 \cap S_1 \neq \emptyset$ (since open)

$$x \in (\alpha - \epsilon, \alpha + \epsilon) \subset S_2$$

$x \in (x-t, x+t) \subset S_1 \cup S_2 = S$

x is an interior point of E .

~~if~~ ~~it~~ ~~is~~ ~~open~~ ~~let~~

1992-03-09 to 1992-03-10

→ The union of an arbitrary family of open sets is an open set.

The intersection of two open sets is an open set.

i) Let s_1 & s_2 be two open sets.

To prove $s_1 \cap s_2$ is also an open set.

Let $s = s_1 \cap s_2$.

Let $x \in s \Rightarrow x \in s_1 \cap s_2$

$\Rightarrow x \in s_1$ and $x \in s_2$

$\Rightarrow x \in (x-\epsilon_1, x+\epsilon_1) \subset s_1$ and

$x \in (x-\epsilon_2, x+\epsilon_2) \subset s_2$

($\because s_1$ & s_2 are two open sets)

Choosing $\epsilon = \min\{\epsilon_1, \epsilon_2\} > 0$ (1)

$x \in (x-\epsilon, x+\epsilon) \subset (x-\epsilon_1, x+\epsilon_1) \subset s_1$ and

$x \in (x-\epsilon, x+\epsilon) \subset (x-\epsilon_2, x+\epsilon_2) \subset s_2$

$\Rightarrow x \in (x-\epsilon, x+\epsilon) \subset s_1 \cap s_2 = s$

$\therefore s = s_1 \cap s_2$ is an open set.

The intersection of a finite collection of open sets is an open set.

The intersection of an infinite collection of open sets need not be an open set.

Ex) Let $s_n = (-\frac{1}{n}, \frac{1}{n})$ for all $n \in \mathbb{N}$

(1) $s_1 \cap s_2 \cap s_3 \cap \dots = (-\frac{1}{3}) \cap (-\frac{1}{2}, \frac{1}{2}) \cap \dots$

$\Rightarrow s_1 \cap s_2 \cap s_3 \cap \dots = \{0\}$

which is not an open set.

Because $(0-\epsilon, 0+\epsilon) \notin \{0\}$.

The intersection of an infinite collection of open sets is not an open set.

(ii) $\text{where } S_n = (0, 1/n)$

$$\text{then } S_1 \cap S_2 \cap \dots = (0, 1) \cap (0, 2) \cap \dots \\ = (0, 1)$$

which is an open set.

The intersection of an infinite collection
of open sets need not be an open set.

Note: Every open interval is an open set.
but every open set need not be an
open interval.

for example, :

let $S_1 = (1, 2)$; $S_2 = (3, 4)$ are two
open sets.

$S_1 \cup S_2 \in (1, 2) \cup (3, 4)$ is an open set

but $(1, 2) \cup (3, 4)$ is not an open
interval.

* Limit point of a subset S of \mathbb{R}

A point $p \in \mathbb{R}$ is said to be a limit point
of a subset S of \mathbb{R} , if every nbd of p has
at least one point of S other than p itself.

(Or) A point $p \in \mathbb{R}$ is said to be a limit point
of a subset S of \mathbb{R} if every nbd of p
has an infinite number of points of S .

(Or) A point $p \in \mathbb{R}$ is said to be a limit point of
subset S of \mathbb{R} if every nbd of p contains

at least one point of S other than p .

i.e., p is a limit point of $S \Leftrightarrow$

$$(p-\epsilon, p+\epsilon) \cap S - \{p\} \neq \emptyset.$$

Notes: (1) limit point is also called cluster point (or) condensation point (or) accumulation point

(2) A limit point of ' S ' may or may not belong to the set ' S '.

(3) A set may have no limit point, a unique limit point or a finite or infinite number of limit points.

(4) $p \in \mathbb{R}$ is not a limit point of a subset

' S ' of \mathbb{R} if there exists a nbhd of ' p ' which does not contain any point of ' S '

(5) p is not a limit point of ' S ' if for some $\epsilon > 0$, $(p-\epsilon, p+\epsilon) \cap S = \emptyset$ (or)

$$(p-\epsilon, p+\epsilon) \cap S = \{p\}.$$

Max infinite set has no limit point

Set A be a finite set

Suppose If possible suppose that p lie a limit point of A . Then let $\epsilon > 0$.

Then $(p-\epsilon, p+\epsilon)$ contains infinite number of points of ' A '.

$\therefore A$ is infinite.

It is a contradiction.

$\therefore A$ has no limit points

For a finite set it has no limit points

Closure of a set :-

The set of all adherent points of a set 'S' is called the closure of S and is denoted by $\text{cl } S$ or \bar{S} .

$$\text{Thus } \bar{S} = S \cup D(S).$$

Dense set:

A subset 'S' of \mathbb{R} is said to be dense (or dense in \mathbb{R} or everywhere dense) if every point of \mathbb{R} is a point of S or a limit point of S or both.

(or)

Let $S \subseteq \mathbb{R}$ then 'S' is said to be dense if $\bar{S} = \mathbb{R}$.

Dense in itself:

A set 'S' is said to be dense-in-itself if every point of S is a limit point of 'S'.

(or)

A subset 'S' of \mathbb{R} is said to be dense-in-itself if $S \subseteq D(S)$.

(or)

A subset 'S' of \mathbb{R} is said to be dense-in-itself if it possesses no isolated points.

perfect set:

A set 'S' is said to be perfect set if $S = D(S)$.

(or)

A set 'S' is said to be perfect set if it is dense-in-itself and if it contains all its limit points.

→ The set \mathbb{Q} of rational numbers.

Let $S = \mathbb{Q} \subseteq \mathbb{R}$

Let x be any real number. Then for each $\epsilon > 0$ (however small),

$(x - \epsilon, x + \epsilon)$ is a nbhd of x

and it contains infinitely many rational numbers other than x .

i.e. $(x - \epsilon, x + \epsilon) \cap \mathbb{Q} - \{x\} \neq \emptyset$

⇒ x is a limit point of $S = \mathbb{Q}$.

⇒ every real number is a limit point of \mathbb{Q} .

Hence the set of the limit points of \mathbb{Q}

is the set of all real numbers \mathbb{R}

$$\therefore [D(\mathbb{Q}) = \mathbb{R}]$$

$$\text{also } S = S \cup D(S)$$

$$= \mathbb{Q} \cup \mathbb{R}$$

$$\boxed{S = \mathbb{R}}$$

clearly ' S ' is dense in \mathbb{R} and $S \subseteq D(S)$

∴ $S = \mathbb{Q}$ is dense in itself.

Since $S \neq D(S)$ —

i.e. $\mathbb{Q} \neq D(\mathbb{Q})$

∴ $S = \mathbb{Q}$ is not a perfect set

→ The $\mathbb{R} - \mathbb{Q}$ of irrational numbers.

Let $S = \mathbb{R} - \mathbb{Q} \subseteq \mathbb{R}$ then

$$D(S) = \mathbb{R}$$

→ The set \mathbb{N} of natural numbers.

Let $S = \mathbb{N} \subseteq \mathbb{R}$

Let $x \in \mathbb{R}$

Adherent point:

A real number ' p ' is called an adherent point of a set $S \subset \mathbb{R}$ if every nbhd of p contains a point of S .

i.e. point $p \in \mathbb{R}$ is an adherent point of $S \subset \mathbb{R}$
 \Leftrightarrow for each nbhd N of p , $N \cap S \neq \emptyset$

Note:- Due to a close resemblance between the definitions of an adherent point of a set and a limit point of a set, the distinction between the two should be carefully noted.

for a point ' p ' to be a limit of a set S , every nbhd N of ' p ' must contain a point of S other than p .

i.e. $N \cap S - \{p\} \neq \emptyset$.

for a point ' p ' to be an adherent point of a set S ; every nbhd of p must contain a point of S which can be ' p ' itself.

i.e. $N \cap S \neq \emptyset$.

If $p \in S$, then ' p ' is an adherent point of S , since every nbhd of p contains p which belongs to S .

If $p \notin S$, then p is a limit point of S and, therefore, every nbhd of ' p ' contains a point of S other than p .

Hence p is also an adherent point of S .
Clearly, a real number p is an adherent point \Leftrightarrow either $p \in S$, or $p \in D(S)$.

Every point of S is an adherent of S .
Every limit point of S is an adherent point.
But an adherent point of S need not be a limit point of S .

Derived Set:

The set of all limit points of a subset 'S' of \mathbb{R} is called the derived set of S and is denoted by S' or $D(S)$.

i.e., $D(S)$ or $S' = \{x \in \mathbb{R} / x \text{ is a limit point of } S\}$

Again the derived set of $D(S)$ is called the second derived set of S and is denoted by $D''(S)$, or S'' .

In general, the n^{th} derived set of S denoted by $D^{(n)}(S)$ or $S^{(n)}$.

→ A set is said to be of first species if it has only a finite number of derived sets. It is said to be of second species if the number of derived sets is infinite.

Note: ① If the set S is finite, then ' S ' has no limit point and consequently, $D(S) = \emptyset$.

② If a set ' S ' is of first species, then its last derived set must be empty.

③ A set whose n^{th} derived set is a finite set so that its $(n+1)^{\text{th}}$ derived set is empty is called a set of n^{th} order.

- $N = \{1, 2, 3, \dots\} \subseteq \mathbb{R}$ has no limit points.
- $A = \{\dots, -3, -2, -1\}$ has no limit points.
- Every point of the set \mathbb{R} of all real numbers is a limit point of \mathbb{R} .
- Let $S = \mathbb{R}$
Let $p \in \mathbb{R}; \epsilon > 0$.
 $(p-\epsilon, p+\epsilon) \cap \mathbb{R} = \text{infinite number of real numbers}$
- Every real number is a limit point of the \mathbb{Q} of all rational numbers.
- Let $S = \mathbb{Q}$
Let $p \in \mathbb{Q}; \epsilon > 0$.
 $(p-\epsilon, p+\epsilon) \cap S = \text{infinite number of rational numbers}$
- Similarly; $S = \mathbb{Q}'$ or $\mathbb{R} \setminus \mathbb{Q}$ has no limit points.
- The empty set \emptyset has no limit points.
- Let $S = \emptyset$
Let $p \in \mathbb{R}$.
 $(p-\epsilon, p+\epsilon) \cap S = \emptyset$ not an infinite set.
- $S = (a, b)$.
Every point of S is a limit point of S .
- $S = [a, b]; (a, b); [a, b]$.
Every point of S is a limit point of S .
- $S = \left\{ \frac{1}{n} \mid n \in \mathbb{N} \right\} = \left\{ 1, \frac{1}{2}, \frac{1}{3}, \dots \right\} \subseteq \mathbb{R}$
- Let $o \in \mathbb{R}; \epsilon > 0$.
 $(o-\epsilon, o+\epsilon) \cap S = \text{infinite set}$
 $\therefore o$ is a limit point of S .
- (Or)
 $\lim_{n \rightarrow \infty} \frac{1}{n} = \frac{1}{\infty} = 0 \notin S$ (i.e., 0 is not a member of S)

$$\rightarrow S = \left\{ \frac{n}{n+1} \mid n \in \mathbb{N} \right\} = \left\{ \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \dots \right\}$$

(or)

$$= \left\{ 1 - \frac{1}{n+1} \mid n \in \mathbb{N} \right\}.$$

Since $\epsilon > 0$, $\exists \delta > 0$ such that $(1-\delta, 1+\delta)$ contains infinitely many points of S .

$\therefore 1$ is a limit point of S and $1 \notin S$.

$\lim_{n \rightarrow \infty} S = 1 \notin S$. 1 is a limit point.

$$\rightarrow S = \left\{ 1 - \frac{1}{n} \mid n \in \mathbb{N} \right\}.$$

$\lim_{n \rightarrow \infty} S = 1 \notin S$
 1 is a limit point of S .

$$\rightarrow S = \left\{ (-1)^n / n \mid n \in \mathbb{N} \right\} = \left\{ \frac{-1}{1}, \frac{1}{2}, \frac{-1}{3}, \frac{1}{4}, \dots \right\}$$

Since $\lim_{n \rightarrow \infty} S = \lim_{n \rightarrow \infty} (-1)^n = \begin{cases} -1 & \text{if } n \text{ is odd} \\ 1 & \text{if } n \text{ is even} \end{cases}$

$\therefore S$ has two limit points -1 and 1 , which are members of S .

$$\rightarrow S = \left\{ (-1)^n n \mid n \in \mathbb{N} \right\} = \left\{ -1, +2, -3, +4, -5, \dots \right\}$$

has no limit points.

Since $\lim_{n \rightarrow \infty} S = \lim_{n \rightarrow \infty} (-1)^n n = \begin{cases} \pm \infty & \text{if } n \text{ is odd} \\ \pm \infty & \text{if } n \text{ is even} \end{cases}$

Note: (1) Every finite set has no limit points.

(2) Every infinite set may or may not have limit points.

(3) Every interior point is a limit point, but every limit point need not be an interior point.

Ex: Let $S = (a, b)$, then $D(S) = [a, b]$ & $S^0 = (a, b)$.

a & b are limit points but not interior points.

→ If the supremum of a set does not belong to the set, then it is a limiting point of the set.

Sol Let S be the non-empty subset of real number set \mathbb{R} .
and has supremum but not belong to the set S .

Let it be ' u '
i.e. $u = \text{supremum of } S$ but $u \notin S$.

Now we have to prove that ' u ' is a limiting point of a set S .
for this we have to prove that every
neighborhood of the point u contains a point of S .

other than u .
Let $(u-\epsilon, u+\epsilon)$ be any nbhd of the point u
where $\epsilon > 0$.

Since $u = \text{l.u.b (Supremum) of } S$.
 $\therefore u$ is not an upperbound of S .

$\therefore \exists$ some $a \in S$ s.t. $a > u-\epsilon$ (1)

Also $a < u < u+\epsilon$ (2) $(\because a \in (u-\epsilon, u+\epsilon))$

from (1) and (2), we have -

$u-\epsilon < a < u+\epsilon$ where $a \neq u$.

$\Rightarrow (u-\epsilon, u+\epsilon)$ contains a
point $a \in S$ (3)

$\Rightarrow u$ is a limiting point of
the set S .

~~If~~ If the supremum of a set does not belong to the set, then it is a limit point of a set.

for example:

① $S = (-\infty, a) \subset \mathbb{R}$

$\therefore S$ is bdd above

and say $a \notin S$

$\therefore a$ is a limiting point of S .

② $S = (a, \infty)$

$\therefore S$ is bdd below by a

and say $a \notin S$

$\therefore a$ is a limiting point of S .

Isolated point:

A point $p \in S$ is called an isolated point of S if p is not a limit point of S , i.e. if \exists a nbd of p which contains no points of S other than p at self.

A set ' S ' is called a discrete set if all pts points are isolated points.

for example: Let $S = \{1, 2, 3, \dots\}$

Since all the points of the set ' S ' are its isolated points and so it is a discrete set.

If x is a limit point of N (i.e. $x \in \text{D}(N)$)
 contains no point of N other than x
 $\therefore x$ is not limit point of set of natural numbers.

If $x \notin N$, then the set of x does not contain any point of S
 $\therefore x$ is not limit point of the set of natural numbers.
 $\therefore N$ has no limit points.

$$\therefore D(N) = \emptyset.$$

Since no point of N is a limit point of N .

All the points of N are isolated points.
 Hence N is discrete set.

Also N is of first species. ($\because D(N) = \emptyset$)

The set of all whole numbers.

The set \mathbb{Z} of all integers.

Let $S = \emptyset \subseteq \mathbb{R}$. Then for each $\epsilon > 0$, there is no point of S in $(x-\epsilon, x+\epsilon) \cap S$.

$$(x-\epsilon, x+\epsilon) \cap \emptyset = \emptyset$$

$\therefore x$ is not a limit point of $S = \emptyset$.

\therefore No real number is a limit of \emptyset .

$$\therefore D(\emptyset) = \emptyset.$$

$$\bar{S} = S \cup D(S).$$

$$= \emptyset \cup \emptyset$$

$$\therefore \bar{S} = \emptyset.$$

Since $\emptyset \subseteq D(\emptyset)$

$\therefore S$ is a dense set itself.

Also $S = D(S)$. i.e. $\emptyset = D(S)$

$\therefore \emptyset$ is perfect set.

→ One set.

Let $x \in \mathbb{R} \subseteq \mathbb{R}$

then for each $\epsilon > 0$, however small
the interval $(x-\epsilon, x+\epsilon)$
contains infinitely many real numbers
other than x .

i.e. x is a limit point of \mathbb{R}

⇒ every real number is a limit
point of \mathbb{R} .

$$\therefore D(\mathbb{R}) = \mathbb{R}$$

$$\bar{\mathbb{R}} = \mathbb{R} \cup D(\mathbb{R})$$

$$\bar{\mathbb{R}} = \mathbb{R}$$

\mathbb{R} is dense set

and it is dense-in-itself

Also it is perfect set ($\because \mathbb{R} = D(\mathbb{R})$)

Note! we have $D(\mathbb{R}) = \mathbb{R}$, $D^2(\mathbb{R}) = D(\mathbb{R})$

$$D^3(\mathbb{R}) = \mathbb{R} \text{ and so on.}$$

∴ for every non-negative integer n , $D^n(\mathbb{R}) = \mathbb{R}$

∴ The number of derived sets of \mathbb{R}
is infinite

∴ \mathbb{R} is of the second species.

$$S = (a, b)$$

if $x \in [a, b]$

then $x < a$ or $x = a$ or $x > a$

If $x = a$, then for every $\epsilon > 0$,

$(a-\epsilon, a+\epsilon) = (a-\epsilon, a+\epsilon)$ contains
infinitely many points of (a, b) to the
right of a .

If $x = b$, then for every $\epsilon > 0$,

$(x-\epsilon, x+\epsilon) = (b-\epsilon, b+\epsilon)$ contains infinitely many points of (a, b) to the left of 'b'.

If $x \in (a, b)$, then for every $\epsilon > 0$,

$(x-\epsilon, x+\epsilon)$ contains infinitely many points of (a, b) .

Thus, if $x \in [a, b]$, then for every $\epsilon > 0$,

$(x-\epsilon, x+\epsilon)$ is a nbd of 'x' containing

infinitely many points of (a, b) .

\Rightarrow every point of $[a, b]$ is a limit point of (a, b) .

$$\therefore D([a, b]) = [a, b].$$

$$\text{since } S = \overline{S} \cup D(S)$$

$$= [a, b] \cup [a, b]$$

$$\boxed{S = [a, b] \subseteq \mathbb{R}}$$

Since $S \subseteq D(S)$ i.e. $[a, b] \subseteq [a, b]$.

$\therefore S$ is dense-in-itself.

Since $S \neq D(S)$.

$\therefore S$ is not a perfect set.

$$\rightarrow S = [a, b]$$

$$\rightarrow S = [a, b]$$

$$\rightarrow S = [a, b]$$

$$\rightarrow S = \left\{ \frac{1}{n} \mid n \in \mathbb{N} \right\} \subseteq \mathbb{R} \quad \text{Here } S \text{ is a perfect set.}$$

Let $p \in \mathbb{R}$. Then for each $\epsilon > 0$ (however small)

If $p = 0$, then for each $\epsilon > 0$ (however small)

$(0-\epsilon, 0+\epsilon)$ is a nbd of '0' and it contains infinitely many points of S other than '0'

$\therefore 0$ is the limit point of S

NOW we shall show that no other real number p other than 0 can be a limit point of S .
The following cases arise:

case(i): If $p < 0$, then $(-\infty, 0)$ is a nbd of p which contains no point of S i.e., $(-\infty, 0) \cap S = \emptyset$.
 $\therefore p$ is not a limit point of S .

case(ii): If $p > 1$, then $(1, \infty)$ is a nbd of p which does not contain any point of S . i.e., $(1, \infty) \cap S = \emptyset$.
 $\therefore p$ is not a limit point of S .

Case(iii): If $p=1$, then $(\frac{1}{2}, \infty)$ is a nbd of p which contains no point of S other than p . i.e., $(\frac{1}{2}, \infty) \cap S \cap \{p\} = \emptyset$.
 $\therefore p$ is not limit point of S .

Conclusion:

If $0 < p < 1$, then $\frac{1}{n} > p$.

$\therefore \exists$ a unique natural number ' n ' such that $n \leq \frac{1}{p} < n+1$.

$$\Rightarrow \frac{1}{n} > p > \frac{1}{n+1}$$

$$\Rightarrow \frac{1}{n+1} < p \leq \frac{1}{n} < \frac{1}{n}$$

\Rightarrow The nbd $\left(\frac{1}{n+1}, \frac{1}{n}\right)$ of p contains only one point $\frac{1}{n}$ of S .

$\therefore p$ is not limit point of S .

Hence 0 is the only limit point of S .

$$D(S) = \{0\}$$

$$\text{Also } D(S) = D(U) = \emptyset.$$

The set S is of the first species and
of first order.

$$\text{and } S = S \cup D(S)$$

$$= \left\{ \frac{1}{n} \mid n \in \mathbb{N} \right\} \cup \{0\}$$

\rightarrow find $S' \subset D(S)$.

$$\text{where } S' = \left\{ \frac{1}{n} \mid n \in \mathbb{Z}, n \neq 0 \right\}.$$

$$\text{Let } S = \left\{ \frac{1}{n} \mid n \in \mathbb{Z}, n \neq 0 \right\} \subseteq [-1, 1] \subset \mathbb{R}$$

Let $p = 0 \in \mathbb{R}$. Then the nbhd of '0' contains
infinitely many numbers.

$\therefore 0$ is a limit of S .

Now we shall show that no real number
 p other than 0 can be a limit point of S' .

The following cases will arise:

case(i) If $p < -1$ then $(-\infty, -1)$ is a nbhd of p
which contains no point of S .

i.e. $(-\infty, -1) \cap S = \emptyset$.
 $\therefore p$ is not a limit point of S .

case(ii) If $p > 1$ then $(1, \infty)$ is a nbhd of p
which contains no point of S .
i.e. $(1, \infty) \cap S = \emptyset$.

case(iii) If $p = 1$ then $(1, \infty)$ is a nbhd of p
which does not contain any
point of S other than p .
i.e. $(1, \infty) \cap S = \{1\} = \emptyset$.
 $\therefore p$ is not a limit point of S .

case(iv) If $p = -1$ then $(-\infty, -1)$ is a nbhd of p
which does not contain any
point of S other than p .
i.e. $(-\infty, -1) \cap S = \{-1\} = \emptyset$.

of S .Case (v) If $0 < p < 1$, then $(\frac{1}{n+1}, \frac{1}{n})$ is a nbhd of p

which contains only one point

 γ_n of S i.e. a finite number of points of S .\therefore p is not a limit point of S .Case (vi) If $-1 < p < 0$. So that $0 < -p < 1$ and $-\frac{1}{p} > 0$, \exists a unique $n \in \mathbb{N}$ s.t.

$$n \leq -\frac{1}{p} < n+1$$

$$\Rightarrow -\frac{1}{n+1} < p < -\frac{1}{n}$$

$$\Rightarrow \gamma_{n+1} < -\frac{1}{n} \leq p < -\frac{1}{n+1}$$

 \Rightarrow the nbhd $(\frac{1}{n+1}, \frac{1}{n})$ of p
contains only one point $-\frac{1}{n}$
of S :\therefore p is not a limit point of S .Hence '0' is the only limit point of S .

$$D(S) = \{0\}$$

$$\text{and } \bar{S} = S \cup \{0\}$$

→ Find the derived set of each of the
following:

(i) $(1, \infty)$ (ii) $(-\infty, 1)$ (iii) $\{\frac{n}{n+1} / n \in \mathbb{N}\}$.

(iv) $\{a + \frac{1}{n} / a \in \mathbb{R} \text{ and } n \in \mathbb{N}\}$

(v) $\{\frac{1 + (-1)^n}{n} / n \in \mathbb{N}\}$, (vi) $\{\frac{1}{2^n} / n \in \mathbb{N}\}$ (vii) $\{\frac{1}{3^n} / n \in \mathbb{N}\}$.

SOL

(i) Let $s = (1, \infty) = \dots$ Let x be any real number.If $x < 1$, then for $\epsilon < 1-x$,

$$(x-\epsilon, x+\epsilon) \cap (1, \infty) = \emptyset.$$

 \Rightarrow any real number < 1 is not a limit point of $(1, \infty)$.

If $x \in [1, \infty)$, then for every $\epsilon > 0$, $(x-\epsilon, x+\epsilon)$ contains infinitely many points of $(1, \infty)$ to the right of 1 .

\Rightarrow Every elt of $[1, \infty)$ is a limit point of $(1, \infty)$.

$\therefore (1, \infty)^l = [1, \infty)$.

(ii) Ans: $(-\infty, -1)^l = (-\infty, -1]$.(iii) Let $S = \left\{ \frac{1+(-1)^n}{n} \mid n \in \mathbb{N} \right\} \subseteq \mathbb{R}$.

when 'n' is odd,

$$\frac{1+(-1)^n}{n} = \frac{1-1}{n} = 0.$$

when 'n' is even,

$$\frac{1+(-1)^n}{n} = \frac{1+1}{n} = \frac{2}{n}.$$

$$\therefore S = \{0\} \cup \left\{ \frac{2}{n} \mid n \in \mathbb{N} \text{ and } n \text{ is even} \right\}$$

$$= \{0\} \cup \left\{ \frac{2}{2}, \frac{2}{4}, \frac{2}{6}, \dots \right\}$$

$$= \{0\} \cup \left\{ 1, \frac{1}{2}, \frac{1}{3}, \dots \right\} \subseteq [0, 1] \subseteq \mathbb{R}.$$

Let $p \in \mathbb{R}$ If $p = 0$ then for each $\epsilon > 0$ (however small),

$(0-\epsilon, 0+\epsilon)$ is a nbd of '0'
and it contains infinitely many points of S other than '0'
 $\therefore 0$ is the limit point of S .

Now we shall show that no other real number p other than '0' can be a limit point of S :

The following cases arise:

case(i) If $p < 0$ then $(-\infty, 0)$ is a hbd of p which contains no point of S .
i.e. $(-\infty, 0) \cap S = \emptyset$.

$\therefore p$ is not a limit point of S .

case(ii) If $p > 1$, then $(1, \infty)$ is a hbd of p which does not contain any point of S .
i.e. $(1, \infty) \cap S = \emptyset$.

$\therefore p$ is not a limit point of S .

case(iii): If $p=1$, then $(\frac{1}{2}, \infty)$ is a hbd of p which contains no point of S .
otherwise

$$\text{i.e. } (\frac{1}{2}, \infty) \cap S - \{1\} = \emptyset$$

$\therefore 'p'$ is not a limit point.

case(iv): If $0 < p < 1$, then $\frac{1}{p} > 1$.

$\therefore \exists$ a unique natural number 'n'
such that $n \leq \frac{1}{p} < n+1$

$$\Rightarrow \frac{1}{n+1} < p < \frac{1}{n}$$

$$\Rightarrow \frac{1}{n+1} < p \leq \frac{1}{n} < \frac{1}{n-1}$$

\Rightarrow The hbd $(\frac{1}{n+1}, \frac{1}{n})$ of p

contains only one point $\frac{1}{n}$ of S .

$\therefore p$ is not limit point of S .

Hence '0' is the only limit point of S .

$$\therefore D(S) = \{0\}$$

$$\rightarrow S = \left\{ \cos\left(\frac{n\pi}{2}\right) / n \in \mathbb{N} \right\} = \dots$$

$$= \{\dots, -1, 0, 1, 0, -1, 0, 1, \dots\}$$

clearly -1, 0, 1 are limit points of S

$$\therefore D(S) = \{-1, 0, 1\}.$$

$$\rightarrow \text{Let } S = \left\{ \sin\left(\frac{n\pi}{2}\right) / n \in \mathbb{N} \right\} \subseteq \mathbb{R}$$

$$\text{Then } D(S) = \{-1, 0, 1\}.$$

$$\rightarrow \text{Let } S = \left\{ \cos\left(\frac{n\pi}{3}\right) / n \in \mathbb{N} \right\} \subseteq \mathbb{R}$$

$$\text{Then } D(S) = \left\{ -\frac{1}{2}, 1, \frac{1}{2}, -1 \right\}.$$

$$\rightarrow \text{Let } S = \left\{ \sin\left(\frac{n\pi}{3}\right) / n \in \mathbb{N} \right\} \subseteq \mathbb{R} \text{ Then}$$

$$D(S) = \left\{ -\frac{\sqrt{3}}{2}, \frac{\sqrt{3}}{2} \right\}.$$

* Existence of limit points of a set:

Bolzano-Weierstrass theorem:

We have seen that a finite set has no limit points. Also we have observed that an infinite set may or may not have a limit point.

for example!

The infinite set \mathbb{N} of natural numbers has no limit point whereas the infinite set $S = \left\{ \frac{1}{n} / n \in \mathbb{N} \right\}$ has '0' as its limit point.

We observe that the set S is bounded.

Now we shall give a theorem which gives us a set of sufficient conditions for a set to have a limit point. This theorem is known as Bolzano-Weierstrass theorem.

Statement:

Every infinite bounded set of real numbers has a limit point.

Note: The converse of the above need not be true.
i.e., An infinite set has a limit point, then the set is not bounded.

for example:

Ex-1 $[a, \infty)$ is an infinite set and has limit points but it is not bounded.

Ex-2 $S = \mathbb{Q}, \mathbb{R} - \mathbb{Q}, \mathbb{R}$

Some results on Derived sets:

→ If A and B be any two subsets of \mathbb{R} ; then

(1) $A \subset B \Rightarrow D(A) \subseteq D(B)$

(2) $D(A \cup B) = D(A) \cup D(B)$

(3) $D(A \cap B) \subseteq D(A) \cap D(B)$

(4) $D(D(A)) \subseteq D(A)$

→ $D(\bigcup_{i=1}^n A_i) = D(A_1) \cup D(A_2) \cup \dots$

→ $D(\bigcap_{i=1}^n A_i) \subseteq D(A_1) \cap D(A_2) \cap \dots$

Note:

(1) The derived set of any bounded set is bounded.

(2) Every infinite bounded set has the greatest and the smallest limit points.

i.e., the derived set of any infinite bounded set attains its bounds.

(3). The smallest and the greatest elements of the derived set $D(S)$ of an infinite and bounded set S always exist.

They are usually denoted by $\underline{\lim} S$ and $\overline{\lim} S$ respectively and are called the inferior (or lower) limit of S and the superior (or upper) limit of S .

Also $\underline{\lim} S \leq \overline{\lim} S$

(4) The supremum (or infimum) of a bounded set S is always members of \bar{S}

(5) If S is bounded then \bar{S} is also bounded

Closed Set

A subset S of \mathbb{R} is said to be closed if its complement (i.e., $S^c = \mathbb{R} - S$) is an open set.

(Or)

A set $S \subset \mathbb{R}$ is said to be closed if every limit point of the set S is a member of the set S .

(Or)

A subset S of \mathbb{R} is said to be closed if $D(S) \subseteq S$

\rightarrow (i) S is closed set $\Leftrightarrow D(S) \subseteq S$

(ii) S is closed set $\Leftrightarrow S^c$ is open.

(iii) S is open set $\Leftrightarrow S^c$ is closed

(iv) S is closed set $\Leftrightarrow \bar{S} = S$

If S is a closed set then every limit point of S is a member of S , but every point of S is not limit point.

(Ex)

$$\begin{aligned} \text{Q1) If } S = \{a\} \text{ then } S^c &= \mathbb{R} - S \\ &= \mathbb{R} - \{a\} \\ &= (-\infty, a) \cup (a, \infty) \end{aligned}$$

Since union of two open sets is again open

$\therefore S^c$ is open.

$\Rightarrow S$ is closed.

(Qv)

$$\begin{aligned} S = \{a\} \text{ then } D(S) &= \emptyset \subseteq S \\ \text{i.e., } D(S) &\subseteq S \\ \therefore S &\text{ is closed.} \end{aligned}$$

(Or)

$$\begin{aligned} S = \{a\} \text{ then } D(S) &= \emptyset \\ \therefore \bar{S} &= S \cup D(S) \\ &= \{a\} \cup \emptyset = \{a\} \\ &= S. \end{aligned}$$

$\therefore \bar{S} = S$

$\therefore S$ is closed.

(Q3) If S be a non-empty finite set.

$$\text{then } D(S) = \emptyset \subseteq S$$

i.e., $D(S) \subseteq S$

$\therefore S$ is closed.

(Q4) If $S = \mathbb{N}$ then $D(S) = \emptyset \subseteq S$.

$$\Rightarrow D(S) \subseteq S$$

$\therefore S$ is closed

Similarly, $S = \mathbb{W}, \mathbb{I}$.

- (4) $S = \mathbb{Q}$
then $D(S) = \mathbb{R} \not\subseteq S$.
 $\Rightarrow S$ is not closed.
- (5) $S = \mathbb{R} - \mathbb{Q}$
then $D(S) = \mathbb{R} \not\subseteq S$.
 $\Rightarrow S$ is not closed.
- (6) $S = (a, b)$
then $D(S) = [a, b] \not\subseteq S$
 $\therefore S$ is not closed.

- (7) $S = [a, b], (a, b]$
then $D(S) = (a, b] \not\subseteq S$
 $\therefore S$ is not closed

- (8) $S = [a, b]$
then $D(S) = [a, b] \subseteq S$
 $\therefore S$ is closed.

- (9) $S = \mathbb{R}$, then $D(S) = \mathbb{R}$
 $\therefore D(S) \subseteq \mathbb{R}$
 $\therefore S$ is closed.

- (10) $S = \mathbb{R}^+$
i.e., $S = \{x | x > 0\}$
 $= (0, \infty)$
 $\Rightarrow D(S) = [0, \infty)$
 $\therefore D(S) \not\subseteq S$
 $\therefore S$ is not closed.

- (11) $S = \mathbb{R}$
 $= (0, 0) \Rightarrow D(S) = (-\infty, 0] \not\subseteq S$
 $\therefore S$ is not closed.

- (12) $S = \{\frac{1}{n} | n \in \mathbb{N}\}$
then $D(S) = \{0\} \not\subseteq S$ ($\because 0 \notin S$)
 $\therefore S$ is not closed.

- (13) $S = \{t_n | n \in \mathbb{Z}\}$ then $D(S) = \{0\} \not\subseteq S$
 $\therefore S$ is not closed.

Note: If a set has no limit point then $\overline{S} = S$.

The intersection of an arbitrary family of closed sets is a closed set.

Sol: Let s_1, s_2, s_3, \dots be closed sets.

then $s_1^c, s_2^c, s_3^c, \dots$ be the open sets.

$$\text{Let } S = s_1 \cap s_2 \cap s_3 \cap \dots$$

$$\Rightarrow S^c = (s_1 \cap s_2 \cap s_3 \cap \dots)^c$$

$$= s_1^c \cup s_2^c \cup s_3^c \cup \dots$$

Since the union of arbitrary family of open sets is open.

$$\Rightarrow S^c \text{ is open}$$

$$\Rightarrow S \text{ is closed set}$$

→ The union of a finite collection of closed sets is a closed set.

Sol: Let s_1, s_2, \dots, s_n be closed sets.

then $s_1^c, s_2^c, s_3^c, \dots, s_n^c$ be the open sets.

$$\text{Let } S = s_1 \cup s_2 \cup \dots \cup s_n$$

$$\Rightarrow S^c = (s_1 \cup s_2 \cup \dots \cup s_n)^c$$

$$= s_1^c \cap s_2^c \cap \dots \cap s_n^c$$

Since intersection of finite collection of open sets is open.

$$\Rightarrow S^c \text{ is an open set}$$

$$\Rightarrow S \text{ is closed set}$$

→ The union of an infinite collection of closed sets need not be a closed set.

Sol³ Let $S_n = [\frac{1}{n}, 1]$ when $n \in \mathbb{N}$.

Then each S_n is a closed set.

Now $\bigcup_{n=1}^{\infty} S_n = S_1 \cup S_2 \cup S_3 \cup \dots$

$$= \{1\} \cup [\frac{1}{2}, 1] \cup [\frac{1}{3}, 1] \cup \dots$$

$$= (0, 1] = S \text{(say)}$$

which is not a closed set (DQ)

The union of an infinite collection of closed sets need not be closed set.

Let 'A' be a closed set and 'B' be an open set.

then (i) $A-B$ is closed (ii) $B-A$ is open.

Sol⁴ Since A is closed $\Rightarrow A^c$ is open

B is open $\Rightarrow B^c$ is closed.

(i) $B-A = B \cap A^c$.

Since B and A^c are open,

$\Rightarrow B \cap A^c$ open.

$\therefore B-A$ is open.

(ii) $A-B = A \cap B^c$.

Since A and B^c are closed,

$\Rightarrow A \cap B^c$ is closed

$\therefore A-B$ is closed.

Compact sets

A non-empty subset of \mathbb{R} is said to be compact if it is closed and bounded.

Eg (i) $S = \emptyset$.

$$D(S) = \emptyset \subseteq S$$

$\Rightarrow S$ is closed and bounded.

$\Rightarrow S$ is compact.

$$D(S) = [a, b] \subseteq S$$

$\therefore S$ is closed and bounded.
 $\therefore S$ is compact.

(3) $S = [-1, 1] \cup [2, 3]$

Since the union of two closed sets is closed
and bounded.

$\therefore S$ is compact.

(4) $S = N,$

$$D(S) = \emptyset \subset N$$

$\therefore S$ is closed but not bounded.
 $\therefore S$ is not compact.

Similarly, $S = W, Z$.

(5) $S = Q \Rightarrow D(S) = \mathbb{R} \not\subseteq Q$

i.e., $D(S) \not\subseteq S$

$\therefore S$ is not closed and not bounded.

$\therefore S$ is not compact.

(6) $S = \mathbb{R} - Q$

$$\Rightarrow D(S) = \mathbb{R} \not\subseteq \mathbb{R} - Q$$

i.e., $D(S) \not\subseteq S$

$\therefore S$ is not closed and bounded

$\therefore S$ is not compact.

(7) $S = \mathbb{R} ; D(S) = \mathbb{R}$

$\therefore D(S) \subseteq \mathbb{R}$

$\therefore S$ is closed but not bounded.

$\therefore S$ is not closed compact.

(8) $S = (a, b) \Rightarrow D(S) = [a, b] \not\subseteq S$

i.e., $D(S) \not\subseteq S$

$\therefore S$ is not closed but S is bounded

$\therefore S$ is not compact.

Similarly $S = [a, b), (a, b]$.

$$(iv) S = \{x : a \leq x\}$$

$$= [a, \infty)$$

$$\Rightarrow D(S) = [a, \infty) \subset S$$

$$\therefore D(S) \subseteq S$$

$\therefore S$ is closed but is not bounded.

$\therefore S$ is not compact.

(v)

$$S = \{1^r, 2^r, 3^r, \dots, (23)^r\}.$$

Since S is finite.

$$\Rightarrow D(S) = \emptyset \subseteq S$$

$$\Rightarrow D(S) \subseteq S$$

$\therefore S$ is closed and bounded

$\therefore S$ is compact.

→ The union of finite family of compact sets is compact.

Sol: Let S_1, S_2, \dots, S_n be compact sets.

Then $S_1, S_2, S_3, \dots, S_n$ be closed and bounded

$$S = \bigcup_{i=1}^n S_i$$

Since the union of finite collection

of closed sets is a closed

set. S is closed.

Now we have to show that S is bounded.

Also $s_i \in [a_i, b_i], 1 \leq i \leq n$.

If $a = \min\{a_1, a_2, \dots, a_n\}$

and $b = \max\{b_1, b_2, \dots, b_n\}$

$$\text{then } S = \bigcup_{i=1}^n S_i \subset [a, b]$$

$\therefore S$ is bounded.

Now S is closed and bounded.

$\therefore S$ is compact.

→ The intersection of an arbitrary family of compact sets, containing atleast one point in common, is compact.

Sol: Let $S_1, S_2, \dots, S_n, \dots$ be arbitrary family of compact sets.

Then $S_1, S_2, \dots, S_n, \dots$ be closed and bounded.

$$S = \bigcap_{i=1}^{\infty} S_i$$

Since the intersection of arbitrary family of closed sets is closed.

∴ S is closed.

Also $S \subseteq S_i$ for each i .

and each S_i bounded.

S is bounded.

∴ S is closed and bounded.

∴ S is compact.

Cover of a set

→ Let 'S' be a set and $\{G_\alpha\}$ be a family of sets.

We say that $\{G_\alpha\}$ is a cover of S, if the union of members of $\{G_\alpha\}$ contains S as a subset i.e., if every point of S belongs to some member of the family $\{G_\alpha\}$.

→ we say that $\{G_\alpha\}$ is an open cover if every member of $\{G_\alpha\}$ is an open set.

(or)

Let S be a set and $\{G_\alpha\}$ be a collection of some open subsets of \mathbb{R} such that $S \cup G_\alpha$. Then $\{G_\alpha\}$ is called an open cover of S.

\rightarrow S.T $G = \{(-n, n) / n \in \mathbb{N}\}$

is an open cover of the set \mathbb{R} .

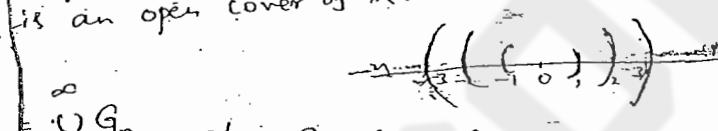

Sol:

$$\text{Given } G = \{(-n, n) / n \in \mathbb{N}\}$$

$$= \left\{ (-1, 1), (-2, 2), (-3, 3), \dots \right\}$$

Since every $x \in \mathbb{R}$ belongs to at least one of the open intervals in G .

$\therefore G_n$ is an open cover of \mathbb{R} .

$$\text{Also } \mathbb{R} = \bigcup_{n \in \mathbb{N}} G_n, \text{ where } G_n = (-n, n)$$

Similarly:

$$G_1 = \{(-2n, 2n) / n \in \mathbb{N}\}$$

$$G_2 = \{(-n, n+2) / n \in \mathbb{Z}\}$$

$$G_3 = \{(-n, n+1) / n \in \mathbb{Z}\} \text{ are open covers of } \mathbb{R}$$

\rightarrow Show that $G_1 = \left\{ \left(\frac{1}{4}, \frac{5}{4}\right), \left(\frac{3}{4}, \frac{7}{4}\right), \left(\frac{5}{4}, \frac{9}{4}\right) \right\}$ is open cover of

interval $[1, 2]$, whereas $G_2 = \left\{ \left(\frac{1}{2}, \frac{5}{4}\right), \left(\frac{3}{2}, \frac{9}{4}\right) \right\}$ is not an open cover of the interval $[1, 2]$.

Sol:

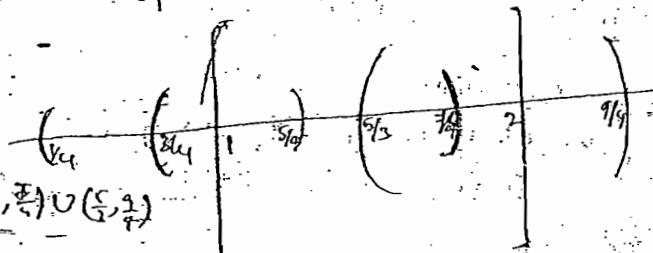

$$\text{Given } G_1 = \left\{ \left(\frac{1}{4}, \frac{5}{4}\right), \left(\frac{3}{4}, \frac{7}{4}\right), \left(\frac{5}{4}, \frac{9}{4}\right) \right\}$$

is an open cover of the interval $[1, 2]$

Since every element of the set $S = [1, 2] = \{x\}$ belongs to at least one of the subsets of G_1 .

and each of the subsets of G_1 is an open set.

$\therefore G_1$ is an open cover of $S = [1, 2]$

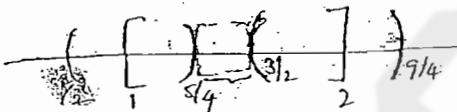

$$\therefore [1, 2] \subset \left(\frac{1}{4}, \frac{5}{4} \right) \cup \left(\frac{3}{4}, \frac{7}{4} \right) \cup \left(\frac{5}{4}, \frac{9}{4} \right)$$

$G_2 = \left\{ \left(\frac{1}{2}, \frac{3}{4} \right), \left(\frac{3}{2}, \frac{9}{4} \right) \right\}$ is not an open cover of the interval $S = [1, 2] = \{x / 1 \leq x \leq 2\}$.

because none of points lies in the interval

$\left[\frac{5}{4}, \frac{3}{2} \right]$ belongs to any of the subsets of G_2 .
 i.e., $S = [1, 2]$ is not covered by union of open sets $\left(\frac{1}{2}, \frac{3}{4} \right)$ & $\left(\frac{3}{2}, \frac{9}{4} \right)$.
 $\therefore G_2$ is not an open cover of S .

Subcover and finite subcover of a set?

Let G be an open cover of a set S . A subcollection E of G is called a subcover of S if E too is a cover of S .

further, if there are only a finite number of sets in E , then we say that E is a finite subcover of the open cover G of S .

If G is an open cover of a set S , then a collection E is a finite subcover of the open cover G provided the following three conditions hold:

- (i) E is contained in G .
- (ii) E is a finite collection.
- (iii) E is itself a cover of S .

Heine-Borel property:

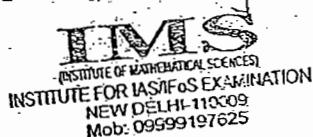

A subset S of \mathbb{R} is said to have the Heine-Borel property if every open cover of S has a finite sub-cover.

Sequence :- A function whose domain is the set \mathbb{N} of all natural numbers and the range is a subset of real numbers is called a sequence. (or) Real sequence.

The sequence is denoted by $x: \mathbb{N} \rightarrow \mathbb{R}$, (or) $\{x_n\}_{n \in \mathbb{N}}$.

A set of numbers which are in correspondence with natural numbers is called a sequence.

- NOTE
- The domain for a sequence is always natural numbers.
 - A sequence is specified by the values $x(n)$ (or) x_n .
 - A sequence may be denoted by $\{x_n : n \in \mathbb{N}\}$.
 - (or) $(x_n : n \in \mathbb{N})$ (or) $x \in \{x_1, x_2, \dots, x_n, \dots\}$
- The values $x_1, x_2, \dots, x_n, \dots$ are called first, second, third... terms of the sequence.
- The m^{th} & n^{th} terms x_m & x_n for $m \neq n$ are treated as distinct terms even if $x_m = x_n$.
- i.e., the terms of a sequence are arranged in a definite order as first, second, third, ... terms and the terms occurring at different positions are treated as distinct terms even if they have the same value.

Range of a sequence

The set of all distinct terms for a sequence is called its range.

- Note: In a sequence $\{x_n : n \in \mathbb{N}\}$ and \mathbb{N} is infinite, the number of terms in a sequence is always infinite.
- The range of a sequence may be finite set.
- Ex: If $x_n \in \{-1, 0, 1\}$; then $\{x_n\} \subseteq \{-1, 0, 1\}$.

- \therefore There are only two distinct elements.
- \therefore The range of a sequence $\{x_n\} = \{-1, +1\}$.
which is finite.

$$\text{Ex: } \{x_n\} = \left\{ \frac{1}{n} \right\}_{n \in \mathbb{N}} \\ = \left\{ 1, \frac{1}{2}, \dots, \frac{1}{n} \right\}$$

All the elements of the sequence are distinct.
 \therefore The range of a sequence is infinite.

Constant sequence: - A sequence $\{x_n\}$ is defined by $x_n = c \forall n \in \mathbb{N}$ is called constant sequence.
i.e., $\{x_n\} = \{c, c, c, \dots, c\}$ is constant sequence
with a range $= \{c\}$
which is a singleton set.

$$\text{Ex: } \{x_n\}_{n \in \mathbb{N}} = \{1\}$$

problem 5

The sequence $\{x_n\}$ is defined by the following formulas for the n^{th} term. write the first five terms in each case.

$$(a) x_n = 1 + (-1)^n \quad (b) x_n = \frac{(1)^n}{n!} \quad (c) x_n = \frac{1}{n(n+1)} \quad (d) x_n = \frac{1}{n^2}$$

The first few terms of a sequence (x_n) are given below. Assuming that the "natural pattern" indicated by these terms persists, give a formula for the n^{th} term x_n .

$$(a) 5, 7, 9, 11, \dots \quad (b) \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \dots$$

$$(c) \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \dots \quad (d) 1, 4, 9, 16, \dots$$

Sol: Let $x = (5, 7, 9, 11, \dots) = (2n+3/n \in \mathbb{N})$.

all two sequences in \mathbb{R} then $x+y = (x_n+y_n)$ in \mathbb{R} is called sum of two sequences.

→ Difference of sequences :- If $x = (x_n)$ and $y = (y_n)$

are two sequences in \mathbb{R} then $x-y = (x_n-y_n)$ in \mathbb{R} is called difference of two sequences.

→ Product of sequences :- If $x = (x_n)$ and $y = (y_n)$

are two sequences then $x \cdot y = (x_n \cdot y_n)$ in \mathbb{R} is called product of two sequences.

→ Quotient :- If $x = (x_n)$, $y = (y_n)$ are two sequences

in \mathbb{R} then $\frac{x}{y} = \left(\frac{x_n}{y_n} \right) (y_n \neq 0)$ is called quotient.

Bounds of a sequence :- If the range of a sequence

is bdd. below, then the sequence is said to be bdd. below

i.e., A sequence $\{x_n\}$ is said to be bdd below if there is $K < 0$ s.t. $x_n \geq K$ $\forall n \in \mathbb{N}$.

→ If the range of a sequence is bdd above then the sequence is said to be bdd above.

i.e., A sequence $\{x_n\}$ is said to be bdd above

if $\exists K \in \mathbb{R}$ s.t. $x_n \leq K \forall n \in \mathbb{N}$.

→ If the range of a sequence is bdd, the sequence is said to be bdd.

i.e., A sequence $\{x_n\}$ is bdd, if it has two real numbers K_1, K_2 s.t. $K_1 \leq x_n \leq K_2 \forall n \in \mathbb{N}$.

→ A sequence is said to be unbdd if it is not bdd.

→ If K is a lowerbound of the sequence $\{x_n\}$, every

real number less than K is also lower bound of $\{x_n\}$.

The greatest of all lower bounds is called glb (or) inf of $\{x_n\}$.

→ If K is an upperbound of the seq. $\{x_n\}$, every real number greater than K is also an upperbound of a seq. $\{x_n\}$. The least of all such

$\rightarrow (1) x = (x_n)$ or $\{x_n\}$ where $x_n \in \mathbb{R} \forall n \in \mathbb{N}$
 $\{x_n\} = \{x_{n/\sqrt{n}}\} = \{1, \sqrt{3}, 3, \dots\}$ is not bdd sequence.
 since L.B = 1 ; U.B is not defined
 \therefore Sequence $\{x_n\}$ is bdd below.

$\rightarrow (2) x = \{x_n / n \in \mathbb{N}\}$.

$\rightarrow (3) x = \{(-1)^n / n \in \mathbb{N}\} = \{-1, 1, -1, 1, \dots\} = \{-1, +1\}$ is bdd seqn
 $L.B = -1, U.B = +1$

$\rightarrow (4) x = \{(-1)^{?n} / n \in \mathbb{N}\}$

$\rightarrow (5) x = \{\sqrt{n} / n \in \mathbb{N}\}$.

Definition: A sequence $\{x_n\}$ is bounded if it is only if
 if the real number M (i.e., $M > 0$) s.t. $\forall n \in \mathbb{N}$,

N.C:

Let $\{x_n\}$ be a bdd seq.

By defn \exists two real numbers b, k s.t
 $b \leq x_n \leq k \quad \forall n \in \mathbb{N} \quad (1)$

Let $M = \max\{|b|, |k|\}$

$\Rightarrow |b| \leq M, |k| \leq M$

$\Rightarrow -M \leq b \leq M \quad -M \leq k \leq M \quad (2)$

from (1), (2) & (3)

$-M \leq b \leq x_n \leq k \leq M \quad \forall n \in \mathbb{N}$

$\Rightarrow -M \leq x_n \leq M \quad \forall n \in \mathbb{N}$

$\Rightarrow |x_n| \leq M \quad \forall n \in \mathbb{N}$.

S.C

$|x_n| \leq M \quad \forall n \in \mathbb{N}$

$\Rightarrow -M \leq x_n \leq M \quad \forall n \in \mathbb{N}$

$\therefore \{x_n\}$ is bdd.

* Limit of a sequence: Let $x = (x_n)$ be a sequence and $x \in \mathbb{R}$, the real number x is said to be the limit of the sequence $\{x_n\}$ if for each $\epsilon > 0$ (however small) $\exists N \in \mathbb{N}$ (depending on ϵ ; i.e., $N(\epsilon)$) such that $\forall n > N$ we have $|x_n - x| < \epsilon$.

Converges $\Rightarrow -\epsilon < x_n - x < \epsilon$ ~~then~~
 $\Rightarrow x - \epsilon < x_n < x + \epsilon$ ~~then~~
 $\Rightarrow x_n \in (x - \epsilon, x + \epsilon)$ ~~then~~

1. Cgt of a sequence — Let (x_n) be a sequence
if $\lim_{n \rightarrow \infty} x_n = x$ then the sequence (x_n) is said
to be cgt to x .

If a sequence (x_n) has a limit then the sequence
 (x_n) is called cgt sequence.

(i) \rightarrow A sequence (x_n) is said to be cgt to x , if for
given $\epsilon > 0$ (however small), \exists a ~~the~~ integer K
 $\in K$ depending on ϵ , i.e., $K(\epsilon)$ s.t. $|x_n - x| < \epsilon$ ~~for all~~
here the real number x is limit of the sequence x_n .

2. Divergence of a sequences — Let (x_n) be a sequence,
if $\lim_{n \rightarrow \infty} x_n = +\infty$ (i) \rightarrow then the sequence (x_n)
is called dgt sequence.

(ii) \rightarrow If a sequence has no limit then the sequence
is called dgt sequence.

(iii) A sequence (x_n) is said to dgt to $+\infty$.
If given any ~~the~~ real number k (however large)
 \exists a ~~the~~ integer m (depending on k) s.t.
 $x_n > k \forall n \geq m$.

i.e., $\lim_{n \rightarrow \infty} x_n = +\infty$ (iv) $x_n \rightarrow \infty$ as $n \rightarrow \infty$.

(iv) A sequence (x_n) is said to dgt to $-\infty$ if given any
real number k (however large) \exists a ~~the~~ integer
 m s.t. $x_n < k \forall n \geq m$.

$n \rightarrow \infty$ $i.e., z_n \rightarrow \infty \text{ as } n \rightarrow \infty$

Oscillatory sequence :- if a sequence (z_n)

neither converges to a finite number nor diverges to $+\infty$ (or) $-\infty$, then the sequence (z_n) is called an oscillatory sequence.

→ If the oscillatory sequence is bdd then the sequence is called finite oscillatory sequence.

→ If the oscillatory sequence is unbdd then the sequence is called an infinite oscillatory seq.

$$\text{Ex: (1)} \quad (z_n) = \left(\frac{1}{n}\right) = \left(1, \frac{1}{2}, \frac{1}{3}, \dots\right)$$

$$\therefore U.B = 1; L.B = 0$$

$$\lim_{n \rightarrow \infty} z_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$$

∴ (z_n) is cgt.

$$(2) \quad (z_n) = \frac{1}{n}$$

$$(3) \quad (z_n) = n^2$$

$$(4) \quad (z_n) = -n$$

$$(5) \quad (z_n) = (-1)^n = (-1, +1, -1, +1, \dots)$$

$$L.B = -1; U.B = +1$$

$$\lim_{n \rightarrow \infty} z_n = -1 \text{ if } n \text{ is odd}$$

$$= +1 \text{ if } n \text{ is even}$$

(z_n) is neither cgt nor dgt.

If it is oscillatory sequence and it is bdd then

finite oscillatory sequence.

$$(6) \quad (z_n) = ((-1)^n \cdot n) = (-1, +2, -3, +4, \dots, -)$$

$$U.B = \text{not defined}; L.B = \text{not defined}.$$

$$\lim_{n \rightarrow \infty} z_n = +\infty \text{ if } n \text{ is even}$$

$$= -\infty \text{ if } n \text{ is odd}$$

∴ It is neither cgt nor dgt.

If it is oscillatory sequence and it is unbdd.

Let it is finite oscillatory sequence.

Null sequence :- A sequence (z_n) is said to be an null sequence

if the limit of the sequence is zero i.e. $\lim_{n \rightarrow \infty} z_n = 0$

i.e., a sequence cannot converge to more than one limit.

Proof : If possible let a sequence (a_n) converge to two distinct limits $x^1 \neq x^2$

$$\text{since } x^1 \neq x^2 \Rightarrow |x^1 - x^2| > 0.$$

let $\epsilon = \frac{1}{2} |x^1 - x^2|$

since the sequence (a_n) cgs to x^1 .

\therefore Given $\epsilon > 0$, \exists a +ve integer K^1 (depending on ϵ)
 $\text{s.t. } |a_n - x^1| < \epsilon/2 \quad \forall n \geq K^1$

and also the sequence (a_n) cgs to x^2 .

\therefore Given $\epsilon > 0$, \exists a +ve integer K^2 (depending on ϵ)

$\text{s.t. } |a_n - x^2| < \epsilon/2 \quad \forall n \geq K^2$

$$\text{Let } K = \max \{K^1, K^2\}$$

then $|a_n - x^1| < \epsilon/2$ & $|a_n - x^2| < \epsilon/2 \quad \forall n \geq K$

$$\begin{aligned} \text{Now } |x^1 - x^2| &= |x^1 - a_n + a_n - x^2| \\ &\leq |x^1 - a_n| + |a_n - x^2| \\ &< \epsilon/2 + \epsilon/2 = \epsilon \end{aligned}$$

$$\therefore |x^1 - x^2| < \epsilon \quad \text{if } n \geq K$$

which is a contradiction to $\epsilon = \frac{1}{2} |x^1 - x^2|$

our assumption that a sequence cgs to two distinct limits x^1, x^2 is wrong.

$$\therefore x^1 = x^2$$

* Theorem Every cgt sequence is bdd.

Pf: Let $X = (x_n)$ be a cgt sequence.
 $\text{It cgs to } x \text{ (say)}$

Given $\epsilon > 0$, \exists a natural number K s.t. $|x_n - x| < \epsilon$ for $n \geq K$

$$\leq |x_{n-1}| + |a|$$

$$\leq E + |a|.$$

$$\text{Let } M = \sup \{ |x_1|, |x_2|, \dots, |x_{k-1}|, E + |a| \}$$

$$\therefore |x_n| \leq M \quad \forall n \in N$$

$\therefore (x_n)$ is bdd.

Note: The converse of above theorem need not be true.

i.e., Every bdd sequence need not be cgt.

$$\text{Ex: } (x_n) = ((-1)^n) \text{ is bdd.}$$

but $x_n = -1$ if n is odd
 $= 1$ if n is even.

\therefore It is an oscillatory sequence.

→ Use the defn. of the limit of a sequence to prove

$$\lim \left(\frac{1}{n} \right) = 0$$

Sol: Given $\epsilon > 0$

$$\text{we have } |\frac{1}{n} - 0| = \frac{1}{n} \quad \text{--- (1)}$$

for given $\epsilon > 0$, by Archimedean Property $\exists K \in \mathbb{N}$ such that

$$\text{if } K \in \mathbb{N}$$

$$\Rightarrow \frac{1}{K} < \epsilon \quad \text{--- (2)}$$

$$\text{Now, we have, } \forall n \geq K \Rightarrow \frac{1}{n} \leq \frac{1}{K}$$

$$\Rightarrow \frac{1}{n} \leq \frac{1}{K} < \epsilon \quad (\text{by (2)}) \quad \text{--- (3)}$$

$$\therefore (0 \in |\frac{1}{n} - 0| = \frac{1}{n} \leq \epsilon \quad (\text{by (3)}) \quad \forall n \geq K)$$

$$\therefore |\frac{1}{n} - 0| < \epsilon \quad \forall n \geq K$$

i.e., $\frac{1}{n} \rightarrow 0$ as $n \rightarrow \infty$. i.e., $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$

- (2) $\lim_{n \rightarrow \infty} \frac{1}{n+1} = 0$ (4) $\lim_{n \rightarrow \infty} \frac{2n}{n+1} = 2$ (6) $\lim_{n \rightarrow \infty} \frac{n-1}{n+3} = 1$ (8) $\lim_{n \rightarrow \infty} \frac{2n}{n+2} = 2$ (10) $\lim_{n \rightarrow \infty} \frac{(-1)^n n}{n+1} = 0$
 (3) $\lim_{n \rightarrow \infty} \left(\frac{n}{n+1} \right) = 1$ (5) $\lim_{n \rightarrow \infty} \frac{3n+1}{2n+5} = \frac{3}{2}$ (7) $\lim_{n \rightarrow \infty} \frac{1}{n+7} = 0$ (9) $\lim_{n \rightarrow \infty} \frac{5}{n+1} = 0$ (11) for any b.c.
 P.T. $\lim_{n \rightarrow \infty} \frac{b}{n+1} = 0$

and let $x \in \mathbb{R}$. if (a_n) is a sequence of the real numbers with $\lim_{n \rightarrow \infty} a_n = 0$ and if for some constant $c > 0$ and some $m \in \mathbb{N}$. we have $|a_n - x| \leq c a_n$ for all $n \geq m$; then it follows that $\lim_{n \rightarrow \infty} a_n = x$.

proof: Since $\lim_{n \rightarrow \infty} a_n = 0$

i.e., $a_n \rightarrow 0$ as $n \rightarrow \infty$

Given $\epsilon > 0$, $\exists K \in \mathbb{N}$ s.t. $\forall n \geq K$

$$\text{such that } n \geq K \Rightarrow |a_n - 0| < \frac{\epsilon}{c}$$

$$\Rightarrow |a_n| < \frac{\epsilon}{c}$$

$$\Rightarrow a_n < \frac{\epsilon}{c} \quad \text{--- (1)}$$

Since $|a_n - x| \leq c a_n$ for all $n \geq m$

$$\text{i.e., } n \geq m \Rightarrow |a_n - x| \leq c a_n < c \left(\frac{\epsilon}{c} \right) \xrightarrow{n \rightarrow \infty} \epsilon$$

$$\Rightarrow |a_n - x| < \epsilon \quad (\text{from (1)})$$

∴ we have $\forall \epsilon > 0 \exists m \in \mathbb{N} \text{ such that } |a_n - x| < \epsilon$.

i.e., $a_n \rightarrow x$ as $n \rightarrow \infty$

i.e., $a_n \in \epsilon \text{ ball}$
 $\xrightarrow{n \rightarrow \infty}$

Bernoulli's Inequality

If $n > 1$ then $(1+x)^n \geq 1+nx \quad \forall n \in \mathbb{N}$

Theorem:

(1) Let $x = (x_n)$ and $y = (y_n)$ be sequences of real numbers that converge to x and y respectively and $c \in \mathbb{R}$ then the sequences $x+y$, xy , $x-y$ and cx converge to $x+y$, xy , $x-y$ and cx respectively.

(2) If $x = (x_n)$ converges to x and $z = (z_n)$ is a sequence of non-zero real numbers that converges to z and if $z \neq 0$ then the quotient sequence $\frac{x_n}{z_n}$ converges to $\frac{x}{z}$.

\rightarrow If $x = (x_n)$ and $y = (y_n)$ are cgt sequences

then $x + y = (x_1 + y_1, x_2 + y_2, \dots, x_n + y_n)$ is also cgt
and $L^f(x_1 + y_1, x_2 + y_2, \dots, x_n + y_n) = L^f x_1 + L^f y_1 + \dots + L^f x_n + L^f y_n$.

\rightarrow (2) $A \cdot B = (a_1 b_1, a_2 b_2, \dots, a_n b_n)$ is cgt sequence
and $L^f(a_1 b_1, a_2 b_2, \dots, a_n b_n) = L^f a_1 \cdot L^f b_1 + \dots + L^f a_n \cdot L^f b_n$.

\rightarrow (3) If $x = (x_n)$ is a cgt sequence then

$$L^f x = \left(L^f (x_n) \right)$$

Theorem: If $x = (x_n)$ is cgt to x and if $x_n \geq 0$ then
then $x = L^f x_n \geq 0$ (i.e., $x \geq 0$)

Proof: If possible suppose that $x < 0$.

Since the sequence (x_n) cgt to x .

$\therefore \exists k \in \mathbb{N}$ s.t. $|x_n - x| < \epsilon$ for all $n \geq k$.

$$\Rightarrow x - \epsilon < x_n < x + \epsilon \quad \forall n \geq k.$$

$$\text{Taking } G = -\frac{\epsilon}{2} \geq 0 \quad (\because x < 0)$$

$$\therefore x + \frac{\epsilon}{2} < x_n < x - \frac{\epsilon}{2} \quad \forall n \geq k.$$

$$x_n < x + \frac{\epsilon}{2} \leq 0 \quad \forall n \geq k.$$

\rightarrow But which is contradiction to the hypothesis

that $x_n \geq 0 \quad \forall n$.

\therefore our supposition that $x < 0$ is wrong.

$$\therefore x \geq 0.$$

Theorem: If $x = (x_n)$ and $y = (y_n)$ are cgt and if

$x_n \leq y_n \quad \forall n$ then $L^f x_n \leq L^f y_n$.

Proof: Since (x_n) & (y_n) cgt sequences
and converge to x & y (say).

$$\therefore L^f x_n = x \quad ; \quad L^f y_n = y$$

Let $z_n = y_n - x_n$; then $z_n \geq 0 \nrightarrow$ ($\because y_n \geq x_n$).

$$\text{Now } \begin{aligned} L^f z_n &= L^f y_n - L^f x_n \\ &= y - x \Rightarrow y - x \geq 0 \Rightarrow y \geq x \Rightarrow L^f y_n \geq L^f x_n. \end{aligned}$$

Theorem :- If $x = (x_n)$ is a convergent sequence and if $a \leq x_n \leq b \forall n \in \mathbb{N}$, then $a \leq \lim x_n \leq b$.

Proof :- Let $y_n = b - x_n$ then

$$y_n \geq 0 \forall n (\because b \geq x_n)$$

$$\therefore \lim y_n = \lim (b - x_n)$$

$$= b - \lim x_n$$

$$\Rightarrow b - \lim x_n \geq 0 (\because y_n \geq 0)$$

$$\Rightarrow b \geq \lim x_n$$

$$\Rightarrow \lim x_n \leq b$$

Similarly $\lim x_n \geq a$ (Let $y_n = x_n - a$)

$$\therefore a \leq \lim x_n \leq b$$

Squeeze theorem

Suppose that $x = (x_n)$, $y = (y_n)$ and $z = (z_n)$ are sequences of real numbers such that $x_n \leq y_n \leq z_n \forall n \in \mathbb{N}$ and that $\lim x_n = \lim z_n = \omega$, then $y = (y_n)$ is convergent and

$$\lim x_n = \lim y_n = \lim z_n = \omega.$$

Proof :- Let $\lim x_n = \lim z_n = \omega$

i.e. the sequences (x_n) & (z_n) are convergent to ω .

Given $\epsilon > 0$, $\exists K \in \mathbb{N}$ such that

$$n \geq K \Rightarrow |x_n - \omega| < \epsilon; |z_n - \omega| < \epsilon$$

$$n \geq K \Rightarrow \omega - \epsilon < x_n < \omega + \epsilon$$

$$\text{and } \omega - \epsilon < z_n < \omega + \epsilon$$

Since $x_n \leq y_n \leq z_n \forall n \in \mathbb{N}$.

\therefore we have $\omega - \epsilon < x_n \leq y_n \leq z_n < \omega + \epsilon \forall n \geq K$

$$\Rightarrow \omega - \epsilon < y_n < \omega + \epsilon \forall n \geq K$$

$$\Rightarrow \{y_n\} \subset \epsilon \forall n \geq K$$

$$\therefore \lim y_n = \omega$$

$\therefore (y_n)$ converges to ω .

and also $\lim x_n = \lim y_n = \lim z_n$.

Theorem :- Let the sequence $x = (x_n)$ converge to ω then the sequence $(|x_n|)$ of absolute values converges to $|\omega|$, i.e. if $\lim x_n = \omega$ then $\lim (|x_n|) = |\omega|$.

Proof :- Since $x = (x_n)$ is convergent to ω .

\therefore Given $\epsilon > 0$, $\exists K \in \mathbb{N}$ such that

$$|x_n - \omega| < \epsilon \forall n \geq K$$

Now we have

$$|(x_n) - |\omega|| \leq |x_n - \omega| < \epsilon \forall n \geq K$$

$$\therefore ||x_n| - |\omega|| < \epsilon \forall n \geq K$$

$\therefore (|x_n|)$ converges to $|\omega|$.

Converse part

$$\text{Ex} : (x_n) = (-1)^n \forall n \in \mathbb{N}$$

Theorem :- Let (x_n) be a sequence of real numbers such that $\lim (|x_n|) = \omega$ exists.

If $|\omega| < 1$ then (x_n) converges and

$$\lim_{n \rightarrow \infty} (x_n) = 0$$

Proof :- Since $x_n > 0 \forall n$

$$\Rightarrow x_{n+1} < x_n$$

$$\therefore \frac{x_{n+1}}{x_n} > 0 \quad \forall n$$

$$\therefore \lim_{n \rightarrow \infty} \left(\frac{x_{n+1}}{x_n} \right) = L \geq 0$$

i.e. $L \geq 0$.

$$\text{Since } \lim_{n \rightarrow \infty} \frac{x_{n+1}}{x_n} = L$$

\therefore Given $\epsilon > 0$, $\exists k \in \mathbb{N}$ such that

$$\left| \frac{x_{n+1}}{x_n} - L \right| < \epsilon \quad \forall n \geq k$$

$$\Rightarrow -\epsilon < \frac{x_{n+1}}{x_n} - L < \epsilon \quad \forall n \geq k$$

$$\Rightarrow L - \epsilon < \frac{x_{n+1}}{x_n} < L + \epsilon \quad \forall n \geq k \quad \text{--- (1)}$$

Now replacing n by $k, k+1, k+2, \dots, n-1$ in (1) we get

$$L - \epsilon < \frac{x_{k+1}}{x_k} < L + \epsilon$$

$$L - \epsilon < \frac{x_{k+2}}{x_{k+1}} < L + \epsilon$$

$$L - \epsilon < \frac{x_{k+3}}{x_{k+2}} < L + \epsilon$$

$$L - \epsilon < \frac{x_n}{x_{n-1}} < L + \epsilon$$

Now multiplying the above $(n-k)$ inequalities, we have

$$(L - \epsilon)^{n-k} < \frac{x_n}{x_k} < (L + \epsilon)^{n-k} \quad \text{--- (2)}$$

Since $L < 1$:

$$\therefore 0 \leq L < L + \epsilon < 1$$

$$\Rightarrow 0 < L + \epsilon < 1 \quad \text{--- (3)}$$

\therefore From (2), we have

$$\frac{x_n}{x_k} < (L + \epsilon)^{n-k}$$

$$\Rightarrow x_n < x_k (L + \epsilon)^{n-k}$$

$$\Rightarrow x_n < x_k (L + \epsilon)^{n-k} \frac{1}{(L + \epsilon)^k}$$

since $x_n > 0 \quad \forall n$

$$\therefore 0 < x_n < x_k (L + \epsilon)^{n-k} \frac{1}{(L + \epsilon)^k} \quad \text{--- (4)}$$

$$\text{Let } m = x_k \frac{1}{(L + \epsilon)^k} > 0$$

$$\therefore 0 < x_n < m(L + \epsilon)^n \quad (\text{by (4)}) \quad \text{--- (5)}$$

since $0 < L + \epsilon < 1$ (by (3))

$$\therefore \lim_{n \rightarrow \infty} (L + \epsilon)^n = 0$$

since the equ (5) is of the form $y_n < x_n < z_n \quad \forall n$

with $\lim y_n = \lim z_n = 0$

By squeeze theorem, $\lim x_n = 0$ and (x_n) is convergent to zero.

$$\frac{x_n}{x_k} = x_{n-k}$$

$$70 \geq 50$$

$$n \geq k$$

$$n = 50, 50+1, 50+2, \dots, 69 \\ k, k+1, k+2, \dots, n-1$$

$$69 - 50 = 20 \text{ terms} \\ n-k = 20$$

Problems

→ Apply above theorem

(i.e. let (x_n) be a sequence of the real numbers such that

$$L = \text{Lt} \left(\frac{x_{n+1}}{x_n} \right) \text{ exists. If } L < 1,$$

then (x_n) converges and

$\text{Lt}_{n \rightarrow \infty} (x_n) = 0$ to the following

sequences, where a, b satisfy

$$0 < a < 1, b > 1.$$

$$(a) \left(\frac{n}{b^n} \right), (b) \left(\frac{2^{3n}}{3^{2n}} \right), (c) \left(\frac{b^n}{2^n} \right)$$

$$\text{Sol}^n:- a) \left(\frac{n}{b^n} \right)$$

$$\text{Let } x_n = \frac{n}{b^n} \text{ then } x_{n+1} = \frac{n+1}{b^{n+1}}$$

$$\begin{aligned} \text{Now } \frac{x_{n+1}}{x_n} &= \frac{n+1}{b^{n+1}} \times \frac{b^n}{n} \\ &= \frac{n+1}{b^n} \\ &= \frac{1+b}{b} \end{aligned}$$

$$\text{Lt} \left(\frac{x_{n+1}}{x_n} \right) = \text{Lt} \left(\frac{1+b}{b} \right)$$

$$= \frac{1+0}{b} = \frac{1}{b} < 1$$

$$(\because b > 1)$$

$$\therefore \text{Lt} \frac{x_{n+1}}{x_n} = \frac{1}{b} < 1. (\text{i.e. } L < 1)$$

$\therefore (x_n)$ converges & $\text{Lt} x_n = 0$.

$$(b) \left(\frac{2^{3n}}{3^{2n}} \right)$$

$$\text{Let } x_n = \frac{2^{3n}}{3^{2n}} \text{ then } x_{n+1} = \frac{2^{3n+3}}{3^{2n+2}}$$

$$\text{Now } \text{Lt}_{n \rightarrow \infty} \left(\frac{x_{n+1}}{x_n} \right) = \text{Lt} \left[\frac{2^{3n+3}}{3^{2n+2}} \times \frac{3^{2n}}{2^{3n}} \right]$$

$$= \text{Lt}_{n \rightarrow \infty} \left(\frac{2^3}{3^2} \right) = \frac{8}{9} < 1$$

$\therefore (x_n)$ is convergent & $\text{Lt} x_n = c$

$$(c) \left(\frac{b^n}{2^n} \right)$$

$$\text{Let } x_n = \frac{b^n}{2^n} \text{ then } x_{n+1} = \frac{b^{n+1}}{2^{n+1}}$$

$$\text{Now } \frac{x_{n+1}}{x_n} = \frac{b^{n+1}}{2^{n+1}} \cdot \frac{2^n}{b^n}$$

$$= b/2$$

$$\therefore \text{Lt} \left(\frac{x_{n+1}}{x_n} \right) = b/2$$

If $1 < b < 2$ then $\text{Lt} \left(\frac{x_{n+1}}{x_n} \right) = b/2 <$

$\therefore (x_n)$ is convergent & $\text{Lt} x_n = 0$.

If $b > 2$ then $\text{Lt} \left(\frac{x_{n+1}}{x_n} \right) = b/2 > 1$

$\therefore (x_n)$ is not convergent & $\text{Lt} x_n \neq$

PROOF

* Cauchy's First theorem

limits

If $\{x_n\}$ converges to l then

converges $\{x_n\}$ where $x_n = a_n + l$

also converges to l (i.e.)

If $a_n \rightarrow l \Rightarrow a_n + l \rightarrow l + l = l$

PROOF :- Let $b_n = a_n - l$ then

$$\text{If } b_n = \text{Lt } a_n - l \text{ then } n \rightarrow \infty$$

$$= l - l$$

$$= 0$$

$$\therefore \lim_{n \rightarrow \infty} b_n = 0$$

$n \rightarrow \infty$

i.e. $b_n \rightarrow 0$ as $n \rightarrow \infty$ — (1)

Since $a_n = b_n + l \forall n$

$$\therefore a_n = \frac{(b_1+l) + (b_2+l) + \dots + (b_n+l)}{n}$$

$$= \frac{(b_1+b_2+\dots+b_n)+nl}{n}$$

$$= \frac{b_1+b_2+\dots+b_n}{n} + l$$

In order to prove that $a_n \rightarrow l$,

For this we are enough to show that

$$\frac{b_1+b_2+\dots+b_n}{n} \rightarrow 0. \quad (2)$$

From (1), $\lim b_n = 0$ i.e. $b_n \rightarrow 0$ as $n \rightarrow \infty$.

Given $\epsilon > 0, \exists m \in \mathbb{N}$ such that

$$|b_n| < \epsilon/2 \quad \forall n \geq m.$$

$$\Rightarrow |b_n| < \epsilon/2 \quad \forall n \geq m. \quad (3)$$

Also the sequence $\{b_n\}$ is convergent

$\therefore \{b_n\}$ is bounded.

$\therefore \exists M > 0$ such that $|b_n| \leq M \forall n$.

$$\quad \quad \quad (4)$$

Now let us prove (2).

We have

$$\begin{aligned} \left| \frac{b_1+b_2+\dots+b_n}{n} - 0 \right| &= \left| \frac{b_1+b_2+\dots+b_n}{n} \right| \\ &= \frac{|b_1+b_2+\dots+b_n|}{n} \end{aligned}$$

$$= \frac{1}{n} \left| b_1+b_2+\dots+b_m + b_{m+1} + b_{m+2} + \dots + b_n \right|$$

($\because n \in \mathbb{N} \Rightarrow m \leq n$)

$$\leq \frac{1}{n} \left[(|b_1| + |b_2| + \dots + |b_m|) + (|b_{m+1}| + |b_{m+2}| + \dots + |b_n|) \right]$$

$$< \frac{1}{n} \left[(M + M + \dots + M \text{ (m times)}) + (\epsilon/2 + \epsilon/2 + \dots + \epsilon/2 \text{ (n-m times)}) \right].$$

$\forall n \geq m$.
Using (3) & (4)

$$\left| \frac{b_1+b_2+\dots+b_n}{n} - 0 \right| < \frac{1}{n} [mM + (n-m)\epsilon/2] \quad \forall n \geq m$$

$$\left| \frac{b_1+b_2+\dots+b_n}{n} - 0 \right| < \frac{mM}{n} + \frac{(n-m)\epsilon}{2n} \quad \forall n \geq m$$

$$< \frac{mM}{n} + \frac{\epsilon}{2}$$

$$\left(\because \frac{n-m}{n} = 1 - \frac{m}{n} < 1 \right) \forall n \geq m \quad (5)$$

$$\text{Now } \frac{mM}{n} < \frac{\epsilon}{2} \text{ if } \frac{n}{mM} > \frac{2}{\epsilon}$$

$$\therefore \Rightarrow \text{if } n > \frac{2mM}{\epsilon}$$

If P is a natural number $> \frac{2mM}{\epsilon}$

then $n \geq P$.

$$\text{Let } q = \max \{P, m\}$$

\therefore From (5),

$$\left| \frac{b_1+b_2+\dots+b_n}{n} - 0 \right| < \frac{\epsilon}{2} + \frac{\epsilon}{2} \quad \forall n \geq q$$

$$= \epsilon.$$

$$\left| \frac{b_1+b_2+\dots+b_n}{n} - 0 \right| < \epsilon \quad \forall n \geq q.$$

$$\frac{b_1 + b_2 + \dots + b_n}{n} \rightarrow 0 \text{ as } n \rightarrow \infty$$

$$x_n \rightarrow l \text{ as } n \rightarrow \infty$$

$$\text{i.e. } \lim_{n \rightarrow \infty} x_n = l$$

Hence the theorem.

Note:— The converse of the above theorem need not be true.

i.e. If the sequence $\{x_n\}$ converges to l then the sequence $\{a_n\}$ need not converge to l .

$$\text{where } x_n = \frac{a_1 + a_2 + \dots + a_n}{n}$$

$$\text{Ex:— Let } \{a_n\} = \{(-1)^n\}$$

$$a = \{-1, +1, -1, +1, \dots\}$$

$$\text{then } x_n = \frac{a_1 + a_2 + \dots + a_n}{n}$$

$$\begin{aligned} &\text{if } n \text{ is even} \\ &\text{then } x_n = \frac{1+1+1+\dots+1}{n} = 0 \quad \text{if } n \text{ is even} \\ &\text{if } n \text{ is odd} \\ &\text{then } x_n = \frac{-1+1+1+\dots+1}{n} = -\frac{1}{n} \quad \text{if } n \text{ is odd.} \end{aligned}$$

$$\therefore \lim_{n \rightarrow \infty} x_n = 0 \text{ i.e. the sequence } \{x_n\}$$

Convergent to 0.

But $\{a_n\}$ is not convergent.

$$\text{because } \lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} (-1)^n = +1 \text{ if } n \text{ is even.}$$

$$= -1 \text{ if } n \text{ is odd.}$$

$\therefore \{a_n\}$ is oscillatory sequence.

It is not convergent.

Now prove

$$\rightarrow \text{show that } \lim_{n \rightarrow \infty} \frac{1}{n} (1 + \frac{1}{2} + \dots + \frac{1}{n}) = 1$$

$$\text{Sol:— Let } a_n = \frac{1}{n} \text{ then } \lim_{n \rightarrow \infty} a_n = 0$$

∴ By Cauchy's first theorem on lim

$$\lim_{n \rightarrow \infty} \frac{a_1 + a_2 + \dots + a_n}{n} = 0$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{2} + \dots + \frac{1}{n}}{n} = 0$$

→ show that

$$\lim_{n \rightarrow \infty} \frac{1}{n} \left(\frac{2}{1} + \frac{3}{2} + \dots + \frac{n+1}{n} \right) = 1$$

$$\text{Let } a_n = \frac{n+1}{n} \text{ then } \lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n+1}{n} = 1$$

∴ By Cauchy's first theorem on lim

$$\lim_{n \rightarrow \infty} \frac{a_1 + a_2 + \dots + a_n}{n} = 1$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{\frac{2}{1} + \frac{3}{2} + \dots + \frac{n+1}{n}}{n} = 1$$

→ show that

$$\lim_{n \rightarrow \infty} \left[\frac{1}{\sqrt{1+n^2}} + \frac{1}{\sqrt{1+2/n^2}} + \dots + \frac{1}{\sqrt{1+1/n^2}} \right] = 1$$

$$\text{L.H.S. } \lim_{n \rightarrow \infty} \left[\frac{1}{\sqrt{1+n^2}} + \frac{1}{\sqrt{1+2/n^2}} + \dots + \frac{1}{\sqrt{1+1/n^2}} \right]$$

$$= \lim_{n \rightarrow \infty} \frac{1}{n} \left[\frac{1}{\sqrt{1+1/n^2}} + \frac{1}{\sqrt{1+2/n^2}} + \dots + \frac{1}{\sqrt{1+1/n^2}} \right]$$

$$= \lim_{n \rightarrow \infty} \frac{1}{n} \left[\frac{1}{\sqrt{1+1/n^2}} + \frac{1}{\sqrt{1+2/n^2}} + \dots + \frac{1}{\sqrt{1+1/n^2}} \right]$$

$$\lim_{n \rightarrow \infty} a_n = \frac{1}{\sqrt{1+\frac{1}{n}}} \quad \text{as } n \rightarrow \infty$$

∴ By Cauchy's first theorem on limits

$$\lim_{n \rightarrow \infty} \frac{a_1 + a_2 + \dots + a_n}{n} = l$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{\left[\frac{1}{\sqrt{1+\frac{1}{1}}} + \frac{1}{\sqrt{1+\frac{1}{2}}} + \dots + \frac{1}{\sqrt{1+\frac{1}{n}}} \right]}{n} = l$$

$$\text{i.e. } \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n^2+1}} + \frac{1}{\sqrt{n^2+2}} + \dots + \frac{1}{\sqrt{n^2+n}} = l$$

→ show that

$$\lim_{n \rightarrow \infty} \left[\frac{1}{\sqrt{n}} + \frac{1}{\sqrt{n+1}} + \dots + \frac{1}{\sqrt{2n}} \right] = \infty$$

$$\text{L.H.S. } \lim_{n \rightarrow \infty} \frac{1}{n} \left[\frac{n}{\sqrt{n}} + \frac{n}{\sqrt{n+1}} + \dots + \frac{n}{\sqrt{2n}} \right] \quad (i)$$

$$\text{Let } a_n = \frac{n}{\sqrt{2n}} \text{ then } a_n = \frac{1}{\sqrt{2}} \sqrt{n}$$

$$\therefore \lim_{n \rightarrow \infty} a_n = \infty$$

∴ By Cauchy's first theorem on limits

$$\lim_{n \rightarrow \infty} \left[\frac{n}{\sqrt{n}} + \frac{n}{\sqrt{n+1}} + \dots + \frac{n}{\sqrt{2n}} \right] = \infty$$

$$\text{i.e. } \lim_{n \rightarrow \infty} \left[\frac{1}{\sqrt{n}} + \dots + \frac{1}{\sqrt{2n}} \right] = \infty$$

→ show that

$$\lim_{n \rightarrow \infty} \left[\frac{1}{n^2} + \frac{1}{(n+1)^2} + \dots + \frac{1}{(2n)^2} \right] = 0$$

If $\{a_n\}$ is a sequence of five terms for all n and if $a_n = l$ then

$$\lim_{n \rightarrow \infty} (a_1, a_2, \dots, a_n)^{1/n}$$

Proof - Let $b_n = \log a_n \forall n (\because a_n > 0)$

$$\text{Since } \lim_{n \rightarrow \infty} a_n = l$$

$$\therefore \lim_{n \rightarrow \infty} b_n = \log l (\because l > 0 \text{ because } a_n > 0 \forall n)$$

∴ By Cauchy's first theorem on limits.

$$\lim_{n \rightarrow \infty} \frac{b_1 + b_2 + \dots + b_n}{n} = \log l$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{\log a_1 + \log a_2 + \dots + \log a_n}{n} = \log l \quad (\text{by (i)})$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{\log [a_1 a_2 \dots a_n]}{n} = \log l$$

$$\Rightarrow \lim_{n \rightarrow \infty} \log (a_1 \dots a_n)^{1/n} = \log l$$

$$\Rightarrow \log \left[\lim_{n \rightarrow \infty} (a_1 a_2 \dots a_n)^{1/n} \right] = \log l$$

$$\Rightarrow \lim_{n \rightarrow \infty} (a_1 a_2 \dots a_n)^{1/n} = l$$

Theorem - If $\{a_n\}$ is a sequence such -

that $a_n > 0 \forall n$ and $\lim_{n \rightarrow \infty} a_n = l$

then $\lim_{n \rightarrow \infty} (a_n)^{1/n} = l$.

Proof - Let us define the

sequence $\{b_n\}$ such that

$$b_1 = a_1, b_2 = \frac{a_2}{a_1}, b_3 = \frac{a_3}{a_2}, \dots, b_n = \frac{a_n}{a_{n-1}}$$

$$\text{Now } \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = l$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{a_n}{a_{n-1}} = l \Rightarrow \lim_{n \rightarrow \infty} b_n = l \quad \text{①}$$

Since $a_n > 0 \forall n$

$\therefore b_n > 0 \forall n$

Now we have a sequence $\{b_n\}$

such that $b_n > 0 \forall n$ and $\lim_{n \rightarrow \infty} b_n = l$

$$\therefore \lim_{n \rightarrow \infty} (b_1 \cdot b_2 \cdots b_n)^{1/n} = l \quad (\text{By previous theorem})$$

$$\Rightarrow \lim_{n \rightarrow \infty} (a_n)^{1/n} = l$$

Note :- the converse of above theorem need not be true.

Ex:- Let $a_n = 2^{-n} + (-1)^n$

$$\text{then } a_n^{1/n} = 2^{-1} + (-1)^{n/2}$$

$$\therefore \lim_{n \rightarrow \infty} a_n^{1/n} = 2^{-1} + \lim_{n \rightarrow \infty} \frac{(-1)^{n/2}}{n} = 1$$

$$\text{But } \frac{a_{n+1}}{a_n} = \frac{2^{-(n+1)} + (-1)^{(n+1)}}{2^{-n} + (-1)^n}$$

$$= 2^{-1} + (-1)^{n+1} \cdot \frac{2^{-n} - 2^{-1}}{2^{-n} + (-1)^n}$$

$$\text{Now } \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = 2^{-1} - 1 = -1 \text{ if } n \text{ is even.}$$

$$= 2^{-1} + 1 = 1 \text{ if } n \text{ is odd}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = 1$$

= 2 if n is odd.

∴ $\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n}$ does not exist.

Note :- The above theorem known as Cauchy's second theorem on limit

Problems

→ Show that $\{n^{1/n}\}$ converges to 1.

Sol'n: Let $a_n = n$, then

$$\frac{a_{n+1}}{a_n} = \frac{(n+1)^{1/(n+1)}}{n^{1/n}}$$

$$= (1 + \frac{1}{n})^{1/(n+1)}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = 1$$

∴ By Cauchy's second theorem on limits,

$$\lim_{n \rightarrow \infty} a_n^{1/n} = 1$$

→ Show that

$$\frac{1}{n} (1 + 2^{1/2} + 3^{1/3} + \cdots + n^{1/n}) = 1$$

First theorem:

→ Find $\lim_{n \rightarrow \infty} (n!)^{1/n}$

Let $a_n = n!$ then $\frac{a_{n+1}}{a_n} = (n+1)!$

$$\text{Now } \frac{a_{n+1}}{a_n} = n+1$$

$$\therefore \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \infty$$

By Cauchy's second theorem on limits,

$\lim_{n \rightarrow \infty} a_n^{1/n} = \infty$

$$\therefore \lim_{n \rightarrow \infty} (n!)^{1/n} = \infty$$

$$\text{i.e. } \lim_{n \rightarrow \infty} (n!)^{1/n} = \infty$$

$$n^n \quad n \rightarrow \infty$$

Sol'n :- Now $x_n = \frac{n!}{n^n}$

$$\Rightarrow x_{n+1} = \frac{(n+1)!}{(n+1)^{n+1}}$$

$$\text{Now } \frac{x_{n+1}}{x_n} = \frac{n! \times (n+1)^{n+1}}{n^n \times (n+1)!}$$

$$= \frac{(n+1)^n}{n^n}$$

$$= \left(1 + \frac{1}{n}\right)^n$$

$$\therefore \lim_{n \rightarrow \infty} \frac{x_{n+1}}{x_n} = \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n}\right)^n = e$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{x_{n+1}}{x_n} = \frac{1}{e} < 1$$

$$\lim x_n = 0$$

$$\Rightarrow \text{If } x_n = \left[\left(\frac{2}{1}\right) \left(\frac{3}{2}\right)^2 \left(\frac{4}{3}\right)^3 \cdots \left(\frac{n+1}{n}\right)^n \right]$$

then show that $\lim_{n \rightarrow \infty} x_n = e$.

$$\text{Let } a_n = \left(\frac{2}{1}\right) \left(\frac{3}{2}\right)^2 \left(\frac{4}{3}\right)^3 \cdots \left(\frac{n+1}{n}\right)^n$$

$$\text{then } a_{n+1} = \left(\frac{2}{1}\right) \left(\frac{3}{2}\right) \left(\frac{4}{3}\right)^3 \cdots \left(\frac{n+2}{n+1}\right)^{n+1}$$

$$\text{Now } \frac{a_{n+1}}{a_n} = \left(\frac{n+2}{n+1}\right)^{n+1}$$

$$= \left(1 + \frac{1}{n+1}\right)^{n+1}$$

$$\therefore \lim \frac{a_{n+1}}{a_n} = e$$

Cauchy's second theorem on limits.

$$\lim_{n \rightarrow \infty} (a_n)^n = e$$

i.e. $\lim x_n = e$

$$\xrightarrow{\text{H.W.}} \text{Prove that } \lim_{n \rightarrow \infty} \left(\frac{n^n}{n!}\right)^{1/n} = e$$

(Cauchy's second theorem)

$$\xrightarrow{\text{H.W.}} \text{Show that } \lim_{n \rightarrow \infty} \left(\frac{n!}{n^n}\right)^{1/n} = e$$

(Cauchy's second theorem)

$$\text{Sol'n} : \lim_{n \rightarrow \infty} \left(\frac{n!}{n^n}\right)^{1/n}$$

Sequence (x_n) be convergent sequence.

Then we have to Prove that (x_n) is bounded.

Sufficient Condition :-

Let the sequence (x_n) be monotone bounded sequence.

Then we have to Prove that the sequence (x_n) is convergent.

Since (x_n) is monotone bounded sequence.

\therefore it is either $M \uparrow$ sequence or $M \downarrow$ sequence.

Also it is bounded above as well as bounded below.

(i) Suppose that the sequence (x_n) is bounded $M \uparrow$ sequence then (x_n) is bounded above.

(ii) Suppose that the sequence (x_n) is bounded $M \downarrow$ sequence then (x_n) is bounded below.

* Limit Points of a sequence

A real number l is said to be limit point of a sequence (x_n) if every neighbourhood of l contains infinitely many terms of the sequence.

i.e. $l \in \mathbb{R}$ is limit point of the

sequence $(x_n) \Leftrightarrow$ every neighbourhood of l contains infinitely many terms of the sequence.

$\Leftrightarrow \forall \epsilon > 0, x_n \in (l-\epsilon, l+\epsilon)$ for infinitely many values of n .

$\Leftrightarrow \forall \epsilon > 0, |x_n - l| < \epsilon$ for infinitely many values of n .

Ex: - (1) $(x_n) = (-1)^n$

$= (-1, +1, -1, +1, -1, \dots)$
has two limit points -1 & $+1$.

Let $x_n = (-1)^n \forall n$

then $x_n = -1$ if n is odd.

and $x_n = +1$ if n is even.

\therefore Every neighbourhood of -1 contains all the odd terms of sequence (x_n) .

$\therefore -1$ is a limit point.

Similarly every neighbourhood of $+1$ contains all even terms of the sequence (x_n) .

$\therefore +1$ is a limit point.

Ex: (2) $(x_n) = (\frac{1}{n})$

$= (\frac{1}{1}, \frac{1}{2}, \frac{1}{3}, \dots)$ has a limit point '0'.

Because the neighbourhood of 0 contains infinitely many terms of the sequence.

where $x_n = l \forall n \in \mathbb{N}$ has the only limit point l .

Note :- (1) A limit point of a sequence is also called cluster point (or) an accumulation point (or) condensation point of the sequence.

(2) Limit point of a sequence is different from limit of a sequence i.e. if $l \in \mathbb{R}$ is the limit of a sequence (x_n) then for $\epsilon > 0$, $\exists m \in \mathbb{N}$ such that $|x_n - l| < \epsilon \forall n \geq m$

$$\Leftrightarrow x_n \in (l-\epsilon, l+\epsilon) \forall n \geq m.$$

i.e. Every neighbourhood of l contains all except a finite number of terms of the sequence.

whereas if $l \in \mathbb{R}$ is a limit point of the sequence (x_n) then every neighbourhood of l contains infinitely many terms of the sequence (x_n) does not exclude the possibility of an infinite number of terms of the sequence lying outside that neighbourhood.

Hence limit of a sequence is a limit point of the sequence, but a limit point of a sequence need not be the limit of the

(3) If $x_n = l$ for infinitely many values of n then l is a limit point of (x_n) .

(4) If for $\epsilon > 0$, $x_n \in (l-\epsilon, l+\epsilon)$ for finitely many values of n then l is not a limit point of the sequence (x_n) .

(5) Limit point of a sequence need not be a term of the sequence.

Bolzano - Weierstrass Theorem for Sequences:

Every bounded sequence has at least one limit point.

Cauchy's General principle of Convergence:-

A necessary and sufficient condition for the convergence of a sequence (x_n) is that, for each $\epsilon > 0$, $\exists m \in \mathbb{N}$ such that

$$|x_{n+p} - x_n| < \epsilon, \forall n \geq m \text{ and } p \geq 1.$$

Necessary Condition:-

Let the sequence (x_n) be convergent and let it be convergent to l .

$$\therefore \lim_{n \rightarrow \infty} x_n = l \\ \text{i.e., } x_n \rightarrow l \text{ as } n \rightarrow \infty$$

Given $\epsilon > 0$, $\exists m \in \mathbb{N}$ such that

$$|x_n - l| < \frac{\epsilon}{2} \quad \forall n \geq m. \quad \text{--- (1)}$$

Since $p \geq 1 \Rightarrow np \geq n+1 \geq m$.

$$|x_{n+p} - l| < \frac{\epsilon}{2} \quad \forall n \geq m \text{ & } p \geq 1 \quad \text{--- (2)}$$

Now we have

$$\begin{aligned} |x_{n+p} - x_n| &= |x_{n+p} - l + l - x_n| \\ &\leq |x_{n+p} - l| + |x_n - l| \\ &< \frac{\epsilon}{2} + \frac{\epsilon}{2} \quad \forall n \geq m \\ &\quad \text{and } p \geq 1. \end{aligned}$$

$$\Rightarrow |x_{n+p} - x_n| < \epsilon \quad \forall n \geq m \text{ and } p \geq 1.$$

Sufficient condition:-

Given that for each $\epsilon > 0$,

$\exists m \in \mathbb{N}$ such that $|x_{n+p} - x_n| < \epsilon$
 $\forall n \geq m$ and $p \geq 1$

In particular $n = m$.

$$\therefore |x_{m+p} - x_m| < \epsilon \quad \forall p \geq 1.$$

$$\Rightarrow -\epsilon < x_{m+p} - x_m < \epsilon \quad \forall p \geq 1.$$

$$\sqrt{\{x_n\}} = \{x_m\} \Rightarrow x_m - \epsilon < x_{m+p} < x_m + \epsilon \quad \forall p \geq 1$$

$$x_m = \frac{1}{m}$$

$$x_{m+1} = \frac{1}{m+1}$$

$$x_{m+2} = \frac{1}{m+2}$$

$$x_{m+3} = \frac{1}{m+3}$$

$$x_{m+4} = \frac{1}{m+4}$$

$$x_{m+97} = \frac{1}{m+97}$$

$$x_{m+98} = \frac{1}{m+98}$$

$$x_{m+99} = \frac{1}{m+99}$$

$$x_{m+100} = \frac{1}{m+100}$$

i.e. the sequence (x_n) has a limit point say l .

we shall show that the sequence (x_n) converges to l :
i.e. $\lim x_n = l \quad \text{--- (3)}$

Given that, for each $\epsilon > 0$, $\exists m$
such that
 $|x_{n+p} - x_n| < \frac{\epsilon}{3} \quad \forall n \geq m \text{ & } p \geq 1 \quad \text{--- (4)}$

In particular, $n = m$

$$\therefore |x_{m+p} - x_m| < \frac{\epsilon}{3} \quad \forall p \geq 1 \quad \text{--- (5)}$$

since l is a limit point:

$$|x_m - l| < \frac{\epsilon}{3} \quad \text{--- (6)}$$

since $m > n$

\therefore from (5),

$$|x_m - x_n| < \frac{\epsilon}{3} \quad \text{--- (7)}$$

Now we have

$$|x_{m+p} - l| = |x_{m+p} - x_m + x_m - x_n + x_n - l|$$

$$\leq |x_{m+p} - x_m| + |x_m - x_n| + |x_n - l|$$

$$< \frac{\epsilon}{3} + \frac{\epsilon}{3} + \frac{\epsilon}{3} + |x_n - l| \quad \forall p \geq 1$$

$$= \epsilon$$

$$\therefore |x_{m+p} - l| < \epsilon \quad \forall p \geq 1$$

$$\therefore |x_n - l| < \epsilon \quad \forall n \geq m.$$

$\therefore (x_n)$ is convergent to l .

\therefore By Bolzano-Weierstrass theorem
every bounded sequence has at

Cauchy Sequence

A sequence (x_n) is said to be Cauchy sequence (or) fundamental sequence.

if for each $\epsilon > 0$, $\exists m \in \mathbb{N}^+$

such that

$$|x_{n+p} - x_n| < \epsilon \quad \forall n \geq m \text{ and } p \geq 1.$$

or) $|s_p - s_q| < \epsilon \quad \forall p, q \geq m.$

Theorem Every Cauchy's sequence is bounded.

Theorem If $x = (x_n)$ is a convergent sequence of real numbers then x is a Cauchy sequence.

Note: A sequence cannot converge if for each $\epsilon > 0$, $\exists m \in \mathbb{N}^+$ such that

$$|x_{n+p} - x_n| \neq \epsilon \quad \forall n \geq m \text{ and } p \geq 1.$$

Theorem : If $y = (y_n)$ is a bounded
decreasing sequence then

$$\lim (y_n) = \inf \{y_n : n \in \mathbb{N}\}$$

further if (y_n) is an unbounded
decreasing then $\lim y_n = -\infty$.
(OR)

Every monotonically decreasing
sequence, which is bounded below
converges to its greatest lower
bound.

further, Every monotonically
decreasing sequence which is not
bounded below diverges to $-\infty$.

Monotone Convergence Theorem

A monotone sequence of real
numbers converges iff it is bounded.

Necessary Condition : Let the monotone

* Monotonic Sequences :- $(i + \frac{1}{n}; n \in \mathbb{N}) = (i+1, i+\frac{1}{2}, i+\frac{1}{3}, \dots)$ are decreasing sequences.

→ A sequence (x_n) is said to be monotonically increasing if

$$x_n \leq x_{n+1} \quad \forall n \in \mathbb{N}; \text{i.e. } x_n \leq x_{n+1} \quad \forall n$$

$$\text{i.e. } x_1 \leq x_2 \leq x_3 \leq \dots \leq x_n \leq x_{n+1}$$

→ A sequence (x_n) is said to be monotonically decreasing if

$$x_n \geq x_{n+1} \quad \forall n \in \mathbb{N}; \text{i.e. } x_n \geq x_{n+1} \quad \forall n$$

$$\text{i.e. } x_1 \geq x_2 \geq x_3 \geq \dots \geq x_n \geq x_{n+1}$$

→ A sequence (x_n) is said to be monotonic if it is either monotonically increasing or monotonically decreasing.

→ A sequence is said to be strictly monotonically increasing if $x_n < x_{n+1} \quad \forall n$.

→ A sequence (x_n) is said to be strictly monotonically decreasing if $x_n > x_{n+1} \quad \forall n$.

→ A sequence (x_n) is said to be strictly monotonic if it is either strictly increasing or strictly decreasing.

Ex-(1) :-

$$(1, 2, 3, 4, \dots, n, \dots), (1, 2, 2, 3, 3, 4, 4, 4, \dots)$$

$(a, a^2, a^3, \dots, a^n, \dots)$ if $a > 1$ are

$$(1 + \frac{1}{n}; n \in \mathbb{N}) = (1, 1 + \frac{1}{2}, 1 + \frac{1}{3}, \dots)$$
 sequences

$$(2, 2^2, 2^3, \dots, 2^n, \dots)$$

$(b, b^2, b^3, \dots, b^n, \dots)$ if $0 < b < 1$.

$$(i + \frac{1}{n}; n \in \mathbb{N}) = (i+1, i+\frac{1}{2}, i+\frac{1}{3}, \dots)$$
 are decreasing sequences.

$$(1, -1, 1, -1, \dots, (-1)^{n+1}, \dots);$$

$(-1, 2, -3, \dots, (-1)^n, n, \dots)$ are not monotonic sequences. Because which are neither increasing nor decreasing.

Theorem : If $x = (x_n)$ is a bounded increasing sequence, then

$$\lim_{n \rightarrow \infty} (x_n) = \sup \{x_n : n \in \mathbb{N}\}. \text{ Furthermore}$$

if (x_n) is unbounded, increasing sequence then $\lim_{n \rightarrow \infty} x_n = \infty$.

(OR) -

Every monotonically increasing sequence which is bounded above converge to its least upper bound.

Further Every monotonically increasing sequence which is not bounded above diverges to ∞ .

Proof :- Case I :

Let $x = (x_n)$ be a bounded increasing sequence.

and let $x = (x_n)$ be a monotonic increasing which is bounded above.

To Prove that the (x_n) converge to its least upper bound.

Since (x_n) is monotonically increasing

Problems

→ use the definition of the limit of a sequence to establish the following limits.

$$(1) \lim_{n \rightarrow \infty} \left(\frac{3n+1}{2n+5} \right) = \frac{3}{2}$$

Sol'n :- Let $\epsilon > 0$ be given

$$\text{Now } \left| \frac{3n+1}{2n+5} - \frac{3}{2} \right| = \left| \frac{-13}{4n+10} \right| \\ = \frac{13}{4n+10} < \frac{13}{4n} < \epsilon$$

$$\text{if } \frac{13}{13} n > \frac{1}{\epsilon}$$

$$\text{i.e. } n > \frac{13}{4\epsilon}$$

Now if m is a +ve integer $> \frac{13}{4\epsilon}$

$$\text{then } \left| \frac{3n+1}{2n+5} - \frac{3}{2} \right| < \epsilon \quad \forall n \geq m$$

$$\therefore \frac{3n+1}{2n+5} \rightarrow \frac{3}{2} \text{ as } n \rightarrow \infty$$

$$\text{i.e. } \lim_{n \rightarrow \infty} \frac{3n+1}{2n+5} = \frac{3}{2}$$

(or)

Now we have

$$\left| \frac{3n+1}{2n+5} - \frac{3}{2} \right| = \left| \frac{-13}{4n+10} \right|$$

$$= \frac{13}{4n+10} < \frac{13}{4n}$$

For $\epsilon > 0$, by Archimedean property

$\exists K \in \mathbb{Z}^+$ such that $K \epsilon > \frac{13}{4}$

$$\Rightarrow \frac{1}{K} < \frac{4}{13} \quad (2)$$

Now we have

$$n \geq K \Rightarrow \frac{1}{n} \leq \frac{1}{K}$$

$$\Rightarrow \frac{1}{n} \leq \frac{1}{K} < \frac{4}{13} \quad (\text{by (2)}) \quad (3)$$

$$\therefore (1) \equiv \left| \frac{3n+1}{2n+5} - \frac{3}{2} \right| < \frac{13}{4} \left(\frac{4}{13} \right) \epsilon \quad \forall n \geq K \quad (\text{by (3)})$$

$$\therefore \left| \frac{3n+1}{2n+5} - \frac{3}{2} \right| < \epsilon \quad \forall n \geq K$$

$$\text{i.e. } \frac{3n+1}{2n+5} \rightarrow \frac{3}{2} \text{ as } n \rightarrow \infty$$

$$\text{i.e. } \lim_{n \rightarrow \infty} \frac{3n+1}{2n+5} = \frac{3}{2}$$

$$(2) \quad \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n+7}} = 0$$

$$(3) \quad \lim_{n \rightarrow \infty} [(-1)^n \cdot \frac{n}{n^2+1}] = 0$$

$$(4) \quad \lim_{n \rightarrow \infty} \frac{1}{3^n} = 0$$

Sol'n :- Let $\epsilon > 0$ be given

Now we have

$$\left| \frac{1}{3^n} - 0 \right| = \left| \frac{1}{3^n} \right|$$

$$= \frac{1}{3^n} < \epsilon \quad \text{if } 3^n > \frac{1}{\epsilon}$$

$$\text{i.e. if } n \log 3 > \log(\frac{1}{\epsilon})$$

$$\text{i.e. if } n > \frac{\log(\frac{1}{\epsilon})}{\log 3} \quad (\because \log$$

Now if m is +ve integer $> \frac{\log(\frac{1}{\epsilon})}{\log 3}$

$$\text{then } \left| \frac{1}{3^n} - 0 \right| < \epsilon \quad \forall n \geq m$$

$$\text{i.e. } \frac{1}{3^n} \rightarrow 0 \text{ as } n \rightarrow \infty$$

$$\text{i.e. } \lim_{n \rightarrow \infty} \frac{1}{3^n} = 0$$

If $x_n = 1 + \frac{(-1)^n}{2^n}$, then we prove

least +ve integer m such that

$$|x_n - 1| < \frac{1}{10^3} \quad \forall n > m.$$

Sol'n: Now $|x_n - 1| = \left| 1 + \frac{(-1)^n}{2^n} - 1 \right|$

$$= \left| \frac{(-1)^n}{2^n} \right|$$

$$= \frac{1}{2^n} \quad \text{--- (1)}$$

Since $|x_n - 1| \leq \frac{1}{10^3}$

$$\Rightarrow \frac{1}{2^n} < \frac{1}{10^3} \quad (\text{by (1)})$$

$$\Rightarrow 2^n > 10^3$$

$$\Rightarrow n > 500$$

Taking $m = 500$,

we have

$$|x_n - 1| < \frac{1}{10^3} \quad \forall n > m \text{ where } m = 500$$

H.W: If $x_n = 2 + \frac{(-1)^n}{n^2}$,

find the least +ve integer m such

$$\text{that } |x_n - 2| < \frac{1}{10^4} \quad \forall n > m.$$

Theorem: Let (x_n) be a sequence of real numbers and let $x \in \mathbb{R}$, if (a_n) is a sequence of +ve real numbers with $\lim_{n \rightarrow \infty} a_n = 0$ and if for some

constant $c > 0$ and some $n \in \mathbb{N}$.

we have $|x_n - x| \leq c a_n \quad \forall n \geq n_0$.

then it follows that

$$\lim_{n \rightarrow \infty} x_n = x.$$

If $a > -1$ then $(1+a)^n > 1+na$

Problems

Q1) If $a > 0$ then $\lim_{n \rightarrow \infty} \left(\frac{1}{1+na} \right) = 0$

Sol'n: Since $a > 0$

$$\Rightarrow na > 0 \quad \forall n \in \mathbb{N}$$

$$\Rightarrow 0 < na < 1+na \quad \forall n \in \mathbb{N}$$

$$\Rightarrow 0 < \frac{1}{1+na} < \frac{1}{na} \quad \forall n \in \mathbb{N}$$

Now we have

$$\left| \frac{1}{1+na} - 0 \right| = \left| \frac{1}{1+na} \right|$$

$$= \frac{1}{1+na} < \frac{1}{na} \quad \forall n \in \mathbb{N}$$

$$= \left(\frac{1}{a} \right) \left(\frac{1}{n} \right) \quad \forall n \in \mathbb{N}.$$

$$\left| \frac{1}{1+na} - 0 \right| < \left(\frac{1}{a} \right) \left(\frac{1}{n} \right) \quad \forall n \in \mathbb{N} \quad \text{--- (1)}$$

Since $\lim_{n \rightarrow \infty} \left(\frac{1}{n} \right) = 0$

and $a > 0$

$$\Rightarrow \frac{1}{a} > 0$$

$$\lim_{n \rightarrow \infty} \left(\frac{1}{1+na} \right) = 0.$$

Q2) If $0 < b < 1$ then $\lim_{n \rightarrow \infty} (b^n) = 0$

Sol'n: Since $0 < b < 1$

$$\text{Take } b = \frac{1}{1+a}$$

$$\text{where } a = \left(\frac{1}{b} \right) - 1$$

$$\Rightarrow a > 0$$

By Bernoulli's inequality,

$$\text{we have } (1+a)^n \geq 1+na \quad \forall n.$$

$$\Rightarrow \frac{1}{(1+a)^n} \leq \frac{1}{1+na} \quad \forall n \in \mathbb{N} \quad \text{--- (2)}$$

$$\begin{aligned} \text{Now, } b^n &= \frac{1}{(1+\alpha)^n} \\ &\leq \frac{1}{1+n\alpha} \quad (\text{by } \textcircled{1}) \\ &< \frac{1}{n\alpha} \quad \forall n \in \mathbb{N} \end{aligned}$$

Now we have

$$\begin{aligned} |b^n - 0| &= \left| \frac{1}{(1+\alpha)^n} - 0 \right| \\ &= \frac{1}{1+n\alpha} \\ &< \frac{1}{n\alpha} \quad (\text{by } \textcircled{2}), \forall n \in \mathbb{N} \\ &= \left(\frac{1}{\alpha} \right) \left(\frac{1}{n} \right) \end{aligned}$$

$$\text{since } \lim_{n \rightarrow \infty} \left(\frac{1}{n} \right) = 0$$

and $\alpha > 0$

$$\Rightarrow \frac{1}{\alpha} > 0.$$

$$\therefore \lim_{n \rightarrow \infty} b^n = 0.$$

Sol'n :- Case(i):

Let $c=1$ then

$$(c^{y_n}) = (1, 1, 1, \dots)$$

$$\therefore \lim_{n \rightarrow \infty} (c^{y_n}) = 1$$

Case(ii): Let $c > 1$

then $c^{y_n} = 1 + d_n$ for some $d_n > 0$

$$c^{y_n} - 1 = d_n$$

$$\text{and } c = (1+d_n)^n \geq (1+nd_n)^n$$

(By Bernoulli's inequality)

$$\Rightarrow c \geq 1 + nd_n \forall n$$

$$\Rightarrow \frac{c-1}{n} \geq d_n \forall n \quad \text{--- (1)}$$

Now we have,

$$\begin{aligned} |c^{y_n} - 1| &= d_n \\ &\leq \frac{c-1}{n} \forall n \quad (\text{by (1)}) \\ &= (c-1) \left(\frac{1}{n} \right) \quad \text{--- (2)} \end{aligned}$$

$$\text{since } \lim_{n \rightarrow \infty} (y_n) = 0$$

$$\text{and } (c-1) > 0 \quad (c > 1)$$

$$\therefore \lim_{n \rightarrow \infty} (c^{y_n}) = 1$$

Case(iii):

Let $0 < c < 1$

then $c^{y_n} = \frac{1}{1+h_n}$ for some $h_n > 0$

$$\Rightarrow c = \frac{1}{(1+h_n)^n} \quad \text{--- (3)}$$

By Bernoulli's inequality,

$$(1+h_n)^n \geq 1+nh_n \forall n \in \mathbb{N}$$

Rough Idea

If $c = 2$ then $c^{y_n} = 2^{y_n}$

$$= 2^1, 2^{\frac{1}{2}}, 2^{\frac{1}{3}}, \dots$$

$$= 2, \sqrt{2}, \sqrt[3]{2}, \dots$$

$$= 2, 1.414, \dots$$

$$= 1+1, 1+0.414, \dots$$

$$= 1+d_n; d_n > 0$$

If $c = 3$ then $c^{y_n} = 3^{y_n}$

$$= 3^1, 3^{\frac{1}{2}}, 3^{\frac{1}{3}}, \dots$$

$$= 3, \sqrt{3}, \sqrt[3]{3}, \dots$$

$$= 3, 1.732, \dots$$

$$= 1+2, 1+0.432, \dots$$

$$= 1+d_n; d_n > 0.$$

Rough Idea

$$c = 0.5$$

$$= \frac{1}{2}$$

$$c^{y_n} = \left(\frac{1}{2}\right)^{y_n}$$

$$= \left(\frac{1}{2}\right)^1, \left(\frac{1}{2}\right)^{\frac{1}{2}}, \left(\frac{1}{2}\right)^{\frac{1}{3}}, \dots$$

$$= \frac{1}{2}, \frac{1}{\sqrt{2}}, \frac{1}{\sqrt[3]{2}}, \dots$$

$$= \frac{1}{1+h_n}; h_n > 0.$$

$$\therefore \frac{1}{1+h_n} \leq \frac{1}{1+n h_n} \quad \forall n \quad (4)$$

from ③ & ④

$$c = \frac{1}{(1+h_n)^n} \leq \frac{1}{1+n h_n} \quad \forall n$$

$$\Rightarrow c \leq \frac{1}{1+n h_n} < \frac{1}{n h_n} \quad \forall n \quad (5)$$

now we have,

$$0 < c < \frac{1}{n h_n} \quad \forall n$$

$$\Rightarrow 0 < h_n < \frac{1}{n} \quad \forall n$$

$$\Rightarrow 0 < h_n < \left(\frac{1}{c}\right) \left(\frac{1}{n}\right) \quad (6)$$

now we have,

$$|c^{n+1} - 1| = \left| \frac{1}{1+h_n} - 1 \right|$$

$$= \left| \frac{-h_n}{1+h_n} \right|$$

$$= \frac{h_n}{1+h_n} < h_n \quad \forall n$$

$$< \left(\frac{1}{c}\right) \left(\frac{1}{n}\right) \quad (by \text{ } (6))$$

Since $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$

$$\therefore c > 0.$$

$$\Rightarrow \frac{1}{c} > 0$$

$$\therefore \lim_{n \rightarrow \infty} c^n = 1.$$

²⁰⁰³ Let 'a' be a +ve real number (ie $a > 0$) and $\{x_n\}$ a sequence of rational numbers such that $\lim x_n = \infty$

Show that

$$\lim a^{x_n} = 1.$$

Soln: Given that $\{x_n\}$ a sequence of rational numbers such that $\lim x_n = \infty$

Let the sequence

$$\{x_n\} = \{\frac{1}{n}\}$$

then we show that

$$\lim a^{\frac{1}{n}} = 1.$$

(proceed as in the above problem.)

→ prove that the sequence whose n th terms are given below, are monotonic. find out whether they are increasing (or) decreasing

$$(i) \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots + \frac{1}{2^n}$$

$$\text{Soln: Let } x_n = \frac{1}{2} + \frac{1}{2^2} + \dots + \frac{1}{2^n}$$

$$\text{and } x_{n+1} = \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots + \frac{1}{2^n} + \frac{1}{2^{n+1}}$$

$$\text{Now } x_{n+1} - x_n = \frac{1}{2^{n+1}} > 0 \quad \forall n$$

$$\Rightarrow x_{n+1} > x_n \quad \forall n$$

$$\Rightarrow x_n < x_{n+1} \quad \forall n$$

$\therefore (x_n)$ is an increasing sequence.

$\therefore (x_n)$ is monotonic sequence.

$$(i) \frac{1}{n} + \frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{2n-1}$$

$$(ii) \frac{3n+7}{4n+8} \quad (iv) \frac{2n+7}{3n+8}$$

$$(v) 1 + \frac{1}{1!} + \frac{1}{2!} + \dots + \frac{1}{(n-1)!}$$

$$(vi) \frac{1}{2n+5} \quad (vii) \frac{1}{2n+1}$$

$$(viii) 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} \quad (ix) \left(1 + \frac{1}{n}\right)^n$$

Solⁿ: Let $x_n = \left(1 + \frac{1}{n}\right)^n$

$$= n c_0 \left(1\right)^n \left(\frac{1}{n}\right)^0 + n c_1 \left(1\right)^{n-1} \left(\frac{1}{n}\right)^1 + \\ + n c_2 \left(1\right)^{n-2} \left(\frac{1}{n}\right)^2 + \dots + \\ + n c_n \left(1\right)^{n-n} \left(\frac{1}{n}\right)^n.$$

$$= 1 + n \cdot \frac{1}{n} + \frac{n(n-1)}{2!} \left(\frac{1}{n^2}\right) + \\ + \frac{n(n-1)(n-2)}{3!} \left(\frac{1}{n^3}\right) + \dots \\ + \frac{n(n-1)(n-2)\dots(2\cdot 1)}{n!} \cdot \frac{1}{n^n}$$

$$= 1 + 1 + \frac{1}{2!} \left(1 - \frac{1}{n}\right) + \frac{1}{3!} \left(1 - \frac{1}{n}\right) \left(1 - \frac{2}{n}\right) \\ + \dots + \frac{1}{n!} \left(1 - \frac{1}{n}\right) \left(1 - \frac{2}{n}\right) \dots \underbrace{\left[1 - \frac{(n-1)}{n}\right]}_{\text{Ans}}$$

$$\text{Now } x_{n+1} = 1 + 1 + \frac{1}{2!} \left(1 - \frac{1}{n+1}\right) +$$

$$+ \frac{1}{3!} \left(1 - \frac{1}{n+1}\right) \left(1 - \frac{2}{n+1}\right) +$$

$$+ \dots + \frac{1}{(n+1)!} \left(1 - \frac{1}{n+1}\right) \left(1 - \frac{2}{n+1}\right) \dots$$

$$+ \left(1 - \frac{n}{n+1}\right) \left(1 - \frac{n-1}{n+1}\right) \dots$$

Now we have,

$$\frac{1}{n+1} < \frac{1}{n} \quad \forall n \in \mathbb{N}$$

$$\Rightarrow \frac{K}{n+1} < \frac{K}{n} \quad \forall n \in \mathbb{N}$$

$$\Rightarrow \frac{-K}{n+1} > \frac{-K}{n} \quad \forall n \in \mathbb{N}$$

$$\Rightarrow 1 - \frac{K}{n+1} > 1 - \frac{K}{n}; K = 3 \cdot 2 \cdot n$$

From (i) & (ii) we have

$$x_{n+1} > x_n \quad \forall n$$

$$\therefore (x_n) \text{ is } M \uparrow$$

$\therefore (x_n)$ is monotonic sequence.

$$(x). a_1 = 1 \text{ and } a_n = \sqrt{2+a_{n-1}}$$

Solⁿ: Given that

$$a_1 = 1 \quad \& \quad a_n = \sqrt{2+a_{n-1}}$$

$$\therefore a_2 = \sqrt{2+a_1}$$

$$= \sqrt{2+1}$$

$$= \sqrt{3} > 1 = a_1$$

$$\therefore a_2 > a_1$$

Similarly $a_3 > a_2$:

Now

Suppose, $a_n > a_{n-1}$ for some n , $n \geq 1$

$$\Rightarrow 2+a_n > 2+a_{n-1}$$

$$\Rightarrow \sqrt{2+a_n} > \sqrt{2+a_{n-1}}$$

$$\therefore a_{n+1} > a_n$$

By mathematical induction

$$a_n < a_{n+1} \quad \forall n$$

(a_n) is an increasing sequence.(a_n) is monotonic sequenceShow that the sequence (x_n) defined by $x_n = (1 + \frac{1}{n})^n$ is

cgt.

Sol: Given that $x_n = (1 + \frac{1}{n})^n$ $\forall n \in \mathbb{N}$

$$\Rightarrow x_n = 1 + 1 + \frac{1}{2!}(1 - \frac{1}{n}) +$$

$$+ \frac{1}{3!}(1 - \frac{1}{n})(1 - \frac{2}{n}) + \dots$$

$$+ \frac{1}{n!}(1 - \frac{1}{n})(1 - \frac{2}{n}) \dots (1 - \frac{n-1}{n})$$

$$\text{and } x_{n+1} = 1 + 1 + \frac{1}{2!}(1 - \frac{1}{n+1})$$

$$+ \frac{1}{3!}(1 - \frac{1}{n+1})(1 - \frac{2}{n+1})$$

$$+ \dots + \frac{1}{(n+1)!}(1 - \frac{1}{n+1})$$

$$(1 - \frac{2}{n+1}) \dots (1 - \frac{n}{n+1})$$

$$\therefore a_n \leq x_{n+1} \quad \forall n$$

(a_n) is an increasing sequence.(x_n) is monotonic sequence

$$\text{Since } x_n = 1 + 1 + \frac{1}{2!}(1 - \frac{1}{n}) +$$

$$+ \frac{1}{3!}(1 - \frac{1}{n})(1 - \frac{2}{n}) + \dots$$

$$+ \frac{1}{n!}(1 - \frac{1}{n})(1 - \frac{2}{n}) \dots (1 - \frac{n-1}{n})$$

$$< 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \dots$$

$$= 1 + 1 + \frac{1}{2!} + \frac{1}{3 \cdot 2 \cdot 1} + \dots$$

$$\frac{1}{n(n-1) \dots 3 \cdot 2 \cdot 1}$$

$$< 1 + 1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots$$

$$= 1 + \left(\frac{1 - \frac{1}{2^n}}{1 - \frac{1}{2}} \right) \quad (\text{by G. a. l. i.})$$

$$= 1 + 2\left(1 - \frac{1}{2^n}\right)$$

$$= 3 - \frac{1}{2^{n-1}}$$

$$< 3 \quad \forall n$$

$$\therefore a_n < 3 \quad \forall n$$

(a_n) is bdd above.Since (x_n) is monotonically increasing & bdd above.(x_n) is cgt.Note: Clearly, $2 \leq x_n \leq 3$

$$\therefore 2 \leq x_n \leq 3 \quad \forall n$$

$$\Rightarrow 2 \leq \lim_{n \rightarrow \infty} x_n \leq 3$$

$$\Rightarrow 2 \leq \lim_{n \rightarrow \infty} (1 + \frac{1}{n})^n \leq 3$$

$$\Rightarrow \lim_{n \rightarrow \infty} (1 + \frac{1}{n})^n = e$$

→ Discuss the convergence of the sequence (x_n)

where

$$(i) \quad x_n = \frac{n+1}{n} \quad (ii) \quad x_n = \frac{n}{n+1}$$

$$(iii) \quad x_n = 1 + \frac{1}{3} + \frac{1}{3^2} + \dots + \frac{1}{3^n}$$

→ P.T the sequence $\left\{\frac{2n-7}{3n+2}\right\}$,

- (i) is monotonically increasing
- (ii) is bounded
- (iii) tends to the limit $\frac{2}{3}$.

Sol: Let $x_n = \frac{2n-7}{3n+2} \forall n$.

$$x_{n+1} < \frac{2n-5}{3n+5}$$

$$\therefore x_{n+1} - x_n = \frac{25}{(3n+5)(3n+2)} > 0 \forall n$$

$$\therefore x_{n+1} > x_n \forall n$$

∴ (x_n) is monotonically increasing.

(ii) The given sequence

$$\left\{-1, -\frac{3}{8}, -\frac{1}{11}, -\frac{1}{14}, -\frac{3}{17}, \dots\right\}_2 \text{ approach to } 1$$

Clearly $x_n > -1 \forall n$

$$\text{and also } 1-x_n = 1 - \frac{2n-7}{3n+2} = \frac{n+9}{3n+2} > 0 \forall n$$

$$\therefore 1-x_n > 0 \forall n$$

$$\Rightarrow 1 > x_n \forall n$$

$$\Rightarrow x_n < 1 \forall n$$

$$\Rightarrow -1 < x_n < 1 \forall n$$

∴ (x_n) is bounded.

(iii) Since (x_n) is M ↑ and bdd above.

∴ It cgs.

$$\text{Now if } x_n = \lim_{n \rightarrow \infty} \frac{2n-7}{3n+2}$$

$$\begin{aligned} &= \lim_{n \rightarrow \infty} \frac{2 - \frac{7}{n}}{3 + \frac{2}{n}} \\ &= \frac{2}{3}. \end{aligned}$$

∴ (x_n) cgs to $\frac{2}{3}$.

H.W. → P.T the sequence

whose nth term is $\frac{3n+4}{2n+1}$

(i) is monotonically decreasing

(ii) is bdd and

(iii) cgs to $\frac{3}{2}$.

Ques: Show that the sequence

(i) defined by $x_{n+1} = \sqrt{3x_n} \forall n$

$x_1 = 1$ cgs to $\frac{3}{2}$.

Sol: Given that $x_1 = 1$,

$$x_{n+1} = \sqrt{3x_n} \forall n$$

$$\begin{aligned} \text{Now } x_2 &= \sqrt{3x_1} \\ &= \sqrt{3(1)} \\ &= \sqrt{3} > 1 = x_1 \\ \therefore x_2 &> x_1 \end{aligned}$$

Similarly $x_3 > x_2$

Now suppose $x_{n+1} > x_n$

$$\Rightarrow 3x_{n+1} > 3x_n$$

$$\Rightarrow \sqrt{3x_{n+1}} > \sqrt{3x_n}$$

$$\Rightarrow x_{n+2} > x_{n+1}$$

By mathematical induction

$$x_{n+1} > x_n \quad \forall n$$

$\therefore (x_n)$ is monotonically increasing.

$$\text{Now } x_1 = 1 < 3$$

$$x_2 = \sqrt{3x_1}$$

$$= \sqrt{3} < 3$$

$$x_3 = \sqrt{3x_2}$$

$$= \sqrt{3 \cdot \sqrt{3}} < 3$$

Suppose $x_n < 3$

$$\text{then } x_{n+1} = \sqrt{3x_n}$$

$$< \sqrt{3 \cdot 3} = 3$$

$$\therefore x_{n+1} < 3$$

By mathematical induction

$$x_n < 3 \quad \forall n$$

$\therefore (x_n)$ is bdd above by 3.
Since (x_n) M.T. and bdd above.

\therefore It is cgt.

Now let $\lim x_n = l$

$$\underset{n \rightarrow \infty}{\text{then}}$$

$$\text{then } \lim_{n \rightarrow \infty} x_{n+1} = l$$

$$\text{Now } x_{n+1} = \sqrt{3x_n} \quad \forall n$$

$$\Rightarrow \lim_{n \rightarrow \infty} x_{n+1} = \sqrt{3 \lim_{n \rightarrow \infty} x_n}$$

$$\Rightarrow l = \sqrt{3l}$$

$$\Rightarrow l^2 - 3l = 0$$

$$\Rightarrow l(l-3) = 0$$

$$\Rightarrow l=0, l=3$$

But $l \neq 0$, since $x_n > 1 \forall$

$\therefore \lim x_n = 3$

$$\underset{n \rightarrow \infty}{\text{l}}$$

Show that the sequence

(x_n) , where $x_1 = 1$ and

$$x_n = \sqrt{2+x_{n-1}} \quad \forall n \geq 2 \text{ is}$$

cgt and cgs to 2.

P.T the sequence $\{x_n\}$ defined by $x_1 = \sqrt{7}$, $x_{n+1} = \sqrt{7+x_n}$ cgs to the true root of the equation $x^2 - x - 7 =$

Solⁿ: Given $x_1 = \sqrt{7}$, $x_{n+1} = \sqrt{7+x_n}$

$$x_2 = \sqrt{7+x_1} \\ = \sqrt{7+\sqrt{7}} > \sqrt{7} = x_1$$

$$\therefore x_2 > x_1$$

$$\text{Similarly } x_3 > x_2$$

Suppose $x_{n+1} > x_n$ for some n .

$$\Rightarrow 7+x_{n+1} > 7+x_n$$

$$\Rightarrow \sqrt{7+x_{n+1}} > \sqrt{7+x_n}$$

$$\Rightarrow x_{n+2} > x_{n+1}$$

\therefore By mathematical induction

$$x_{n+1} > x_n \quad \forall n$$

$\therefore (x_n)$ is M↑

$$\text{Now } x_1 = \sqrt{7} < 7$$

$$x_2 = \sqrt{7+\sqrt{7}} \leq 7$$

Similarly $x_3 < 7$

Suppose $x_n < 7$

$$\Rightarrow 7+x_n < 14$$

$$\Rightarrow \sqrt{7+x_n} < \sqrt{14}$$

$$\Rightarrow x_{n+1} < \sqrt{14} < \sqrt{49} = 7$$

$$\Rightarrow x_{n+1} < 7$$

By mathematical induction

$$x_n < 7 \quad \forall n$$

$\therefore (x_n)$ is bdd above.

Since (x_n) is M↑ *

bdd above.

\therefore It is cgt.

$$\text{Let } 7+x_n = l \quad *$$

$\forall n$

$$\text{Hence } x_{n+1} =$$

$\forall n$

$$\text{Now } x_{n+1} = \sqrt{7+x_n}$$

$$\Rightarrow 7+x_{n+1} = \sqrt{7+7+x_n}$$

$$\Rightarrow l = \sqrt{7+l}$$

$$\Rightarrow l^2 - l - 7 = 0$$

$$\Rightarrow l = \frac{1 \pm \sqrt{29}}{2}$$

$$\text{But } l = \frac{1 + \sqrt{29}}{2} > 0 \text{ where}$$

as $x_n > 0$

$$\therefore l \neq \frac{1 - \sqrt{29}}{2}$$

$$\therefore x_n \text{ cgs to } \frac{1 + \sqrt{29}}{2}$$

which is +ve root of
the equation $x^2 - x - 7 = 0$

H.W.P. of the sequence $\{x_n\}$

defined by $x_1 = \sqrt{7}$, $x_{n+1} = \sqrt{7+x_n}$

cgs to the +ve root of

the equation

$$x^2 - x - 7 = 0$$

\Rightarrow Let $x_1 = 8$ and $x_{n+1} = \frac{1}{2}x_n + 2$ $\forall n$

Show that (x_n) is bdd and monotone, find the limit.

Sol: Given that

$$x_1 = 8, x_{n+1} = \frac{1}{2}x_n + 2$$

$$x_2 = \frac{1}{2}x_1 + 2$$

$$\therefore x_2 = \frac{1}{2}(8) + 2 = 6 < 8 = x_1$$

$$\therefore x_2 < x_1$$

Similarly $x_3 < x_2$.

Now suppose $x_{n+1} < x_n$ for some n .

$$\Rightarrow x_{n+1} < \frac{1}{2}x_n$$

$$\Rightarrow \frac{1}{2}x_{n+1} + 2 < \frac{1}{2}x_n + 2$$

$$\Rightarrow x_{n+2} < x_{n+1}$$

\therefore by mathematical induction

$$x_{n+1} < x_n \quad \forall n.$$

$\therefore (x_n)$ is monotonically decreasing.

But w.k.t every decreasing sequence is always bdd below.

Since $x_n \geq x_{n+1} \quad \forall n \in \mathbb{N}$.

$$\Rightarrow x_n > \frac{1}{2}x_n + 2 \quad \forall n$$

$$\Rightarrow x_n > x_n + 4 \quad \forall n$$

$$\Rightarrow x_n > 4 \quad \forall n$$

$\therefore (x_n)$ is bdd below

$\therefore (x_n)$ is bdd.

Since (x_n) is M↓ and bdd below.

\therefore It is cgt.

$$\text{Let } \lim_{n \rightarrow \infty} x_n = l \quad \& \quad \lim_{n \rightarrow \infty} x_{n+1} = l$$

$$\text{Since } x_{n+1} = \frac{1}{2}x_n + 2 \quad \forall n$$

$$\Rightarrow \lim_{n \rightarrow \infty} x_{n+1} = \frac{1}{2}\lim_{n \rightarrow \infty} x_n + 2$$

$$\Rightarrow l = \frac{1}{2}l + 2$$

$$\Rightarrow l = 4$$

$$\therefore \lim_{n \rightarrow \infty} x_n = 4.$$

H.D. Let $y = (y_n)$ be defined inductively by $y_1 = 1$;

$$y_{n+1} = \frac{1}{4}(2y_n + 3) \quad \forall n \geq 1$$

Show that $\lim_{n \rightarrow \infty} y_n = \frac{3}{2}$

H.W. Let $z = (z_n)$ be the sequence of real numbers defined by

$$z_1 = 1, z_{n+1} = \sqrt{2z_n} \quad \text{for } n \in \mathbb{N}$$

then show that

$$\lim_{n \rightarrow \infty} z_n = 2$$

$\rightarrow \text{Let } y_1 = p, y_{n+1} = \sqrt{p+y_n}$
for $n \in \mathbb{N}$

Show that (y_n) cgs and find limit.

$$\text{Sol: } y_1 = \sqrt{p}; p > 0 \quad \&$$

$$y_{n+1} = \sqrt{p+y_n} \quad \forall n$$

$$\text{Now } y_2 = \sqrt{py_1} \\ = \sqrt{p+p} > \sqrt{p} = y_1$$

$$\therefore y_2 > y_1$$

$$\text{Similarly } y_3 > y_2$$

$$\text{Now suppose, } y_{n+1} > y_n$$

$$\Rightarrow p+y_{n+1} > p+y_n; \quad p > 0$$

$$\Rightarrow \sqrt{p+y_{n+1}} > \sqrt{p+y_n}$$

$$\Rightarrow y_{n+2} > y_{n+1}$$

\therefore By mathematical induction

$$y_{n+1} > y_n \quad \forall n$$

$\therefore (y_n)$ is M.P.

Since $y_n \leq y_{n+1} \forall n$

$$\Rightarrow y_n < \sqrt{p+y_n} \quad \forall n$$

$$\Rightarrow y_n < p+y_n \quad \forall n$$

$$\Rightarrow y_n - y_n - p < 0 \quad \forall n$$

$$\Rightarrow \left[y_n - \frac{1+\sqrt{1+4p}}{2} \right] \left[y_n - \frac{1-\sqrt{1+4p}}{2} \right] < 0$$

$$\Rightarrow \left[y_n - \frac{1+\sqrt{1+4p}}{2} \right] < 0 \quad (\because 1-\sqrt{1+4p} < 0)$$

$$\Rightarrow y_n < \frac{1+\sqrt{1+4p}}{2} \quad \forall n \\ < \frac{1+1+\sqrt{1+4p}}{2} \\ < \frac{1+\sqrt{1+4p}}{2} \\ < 1 + \frac{\sqrt{4p}}{2} \\ < 1 + \sqrt{p}$$

$\therefore (y_n)$ is bdd.
Since (y_n) is M.P.
bdd above.
 \therefore It is cgt.

To find limit of (y_n)

$$\text{Let } \lim_{n \rightarrow \infty} y_n = l \quad \& \quad \lim_{n \rightarrow \infty} y_{n+1} = l$$

$$\text{Now } y_{n+1} = \sqrt{p+y_n}; p > 0$$

$$\Rightarrow \lim_{n \rightarrow \infty} y_{n+1} = \lim_{n \rightarrow \infty} \sqrt{p+y_n}$$

$$\Rightarrow l = \sqrt{p+l}$$

$$\Rightarrow l^2 - l - p = 0$$

$$\Rightarrow l = \frac{1 \pm \sqrt{1+4p}}{2}$$

$$\therefore l = \frac{1+\sqrt{1+4p}}{2} \quad (\because l = 1 - \sqrt{1+4p} \text{ out } y_n > 0)$$

$$\therefore \text{If } y_n = \frac{l}{2} (1 + \sqrt{1+4p}).$$

- Let $y_n = \sqrt{n+1} - \sqrt{n}$ when
 - Show that (y_n) and $(\sqrt{y_n})$
 - converge . find their limits

$$\begin{aligned}
 & \text{Soln} \quad (3) \quad y_n = \sqrt{n+1} - \sqrt{n} \\
 & = \frac{(\sqrt{n+1} - \sqrt{n})(\sqrt{n+1} + \sqrt{n})}{\sqrt{n+1} + \sqrt{n}} \\
 & = \frac{1}{\sqrt{n+1} + \sqrt{n}} \\
 & \leq \frac{1}{\sqrt{n+1} + \sqrt{n}} \left(-\sqrt{n+1} \right)
 \end{aligned}$$

$$\therefore y_n \leq \frac{1}{2^n} \quad \text{(A)}$$

Since $0 < y_n$ on

- from A S(B)

we have

$$0 < y_n \leq \frac{1}{2\sqrt{n}}$$

which is in the form
of $x_n \leq y_n \leq z_n$.

With $\lim_{n \rightarrow \infty} z_n = 0 = \lim_{n \rightarrow \infty} z'_n$

By Squeeze theorem

- Et yin et

$\therefore (y_n)$ goes to zero

$$\text{(ii)} \quad \sqrt{n} y_n = \sqrt{n} \left(\frac{1}{\sqrt{n+1} + \sqrt{n}} \right) \\ \leq \sqrt{n} \left(\frac{1}{2\sqrt{n}} \right) \quad (\text{By (A)}) \\ = \frac{1}{2} \\ \therefore \sqrt{n} y_n \leq \frac{1}{2} \quad \text{--- } \textcircled{C}$$

Now since

$$\begin{aligned} \sqrt{n+1} + \sqrt{n+1} &> \sqrt{n+1} + \sqrt{n} \\ \Rightarrow 2\sqrt{n+1} &> \sqrt{n+1} + \sqrt{n} \\ \Rightarrow \frac{1}{2\sqrt{n+1}} &< \frac{1}{\sqrt{n+1} + \sqrt{n+1}} \\ \Rightarrow \frac{\sqrt{n}}{2\sqrt{n+1}} &< \frac{\sqrt{n}}{\sqrt{n+1} + \sqrt{n+1}} \\ \Rightarrow \frac{1}{2\sqrt{1+\frac{1}{n}}} &< \sqrt{n} y_n. \end{aligned}$$

from C & D we have

$$\frac{1}{2\sqrt{1+\frac{1}{n}}} < \sqrt{n} y_n \leq \frac{1}{2}$$

of the form

$$z_m < v_n \leq z_n$$

With $\lim a_n = \lim z_n = k$

By squeeze theorem

$$f_1(f_n y_n) = y_2$$

- 5 → 8 -

→ Establish the convergence
of the sequence (y_n) .

where $y_n = \frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{2n}$
 $n \in \mathbb{N}$

$$\text{Sol: } Y_{nfl} = \frac{1}{n+2} + \frac{1}{n+3} + \cdots + \frac{1}{2n+1}$$

$$\text{Now } Y_{nt+2} - Y_{nt+1} = \left[\frac{1}{w_{nt+2}} + \frac{1}{w_{nt+3}} + \dots + \frac{1}{w_{nt+2k}} \right] - \left[\frac{1}{w_{nt+1}} + \frac{1}{w_{nt+2}} + \dots + \frac{1}{w_{nt+k}} \right]$$

$$\begin{aligned} &= \frac{1}{n+1} + \frac{1}{n+2} - \frac{1}{n+1} \\ &= \frac{1}{2(n+1)(n+2)} > 0 \quad \forall n \end{aligned}$$

$\therefore y_{n+1} > y_n \quad \forall n$

$\therefore (y_n)$ is M↑

$$\begin{aligned} \text{Now } y_n &= \frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{n+n} \\ &< \frac{1}{n+1} + \frac{1}{n+1} + \dots + \frac{1}{n+1} \\ &< \frac{1}{n} + \frac{1}{n} + \dots + \frac{1}{n} \\ &= \frac{n}{n} \\ &= 1 \end{aligned}$$

$\therefore y_n < 1 \quad \forall n \in \mathbb{N}$

$\therefore (y_n)$ is bdd above.

$\therefore (y_n)$ is cgt

→ If (b_n) is bdd sequence
and $\lim(a_n) = 0$ then show
 $\lim(a_n b_n) = 0$.

Sol: Since (b_n) is bdd
sequence.

$\exists M > 0$ such that

$$|b_n| \leq M \quad \forall n$$

and since $a_n \rightarrow 0$
 $\Rightarrow a_n \rightarrow 0 \quad \forall n \in \mathbb{N}$

i.e., $a_n \rightarrow 0 \quad \forall n \in \mathbb{N}$

Given, $\epsilon > 0 \exists K \in \mathbb{N}$

such that $|a_n - 0| < \frac{\epsilon}{M}$,

$$(M > 0)$$

$$\frac{\epsilon}{M} > K$$

Now we have

$$|a_n b_n - 0| = |a_n b_n|$$

$$= |a_n| |b_n|$$

$$< \frac{\epsilon}{M} \cdot M$$

$\Rightarrow \epsilon$

$\therefore |a_n b_n - 0| < \epsilon \quad \forall n \in \mathbb{N}$

$\therefore \lim(a_n b_n) = 0$

$n \rightarrow \infty$

Set - IIIInfinite Series

If $\{x_n\}$ is a sequence of real numbers, then the expression $x_1 + x_2 + x_3 + \dots + x_n + \dots$ (i.e., the sum of the terms of the sequence, which are infinite in number) is called an infinite series.

The infinite series $x_1 + x_2 + x_3 + \dots + x_n + \dots$ is usually denoted by $\sum_{n=1}^{\infty} x_n$ or Σx_n .

The numbers $x_1, x_2, x_3, \dots, x_n, \dots$ are called the first, second, third, ..., n^{th} term (or general term) of the series.

Series of positive terms: If all the terms of the series $\Sigma x_n = x_1 + x_2 + x_3 + \dots + x_n + \dots$ are positive i.e., if $x_n > 0$, then the series Σx_n is called a series of positive terms.

Alternating series:-

A series in which the terms are alternatively +ve and -ve is called an alternating series.

$$\text{i.e., } \sum_{n=1}^{n-1} (-1)^{n-1} x_n = x_1 - x_2 + x_3 - x_4 + \dots + (-1)^{n-1} x_n$$

where $x_n > 0 \forall n$ is an alternating series.

Partial Sums:-

If $\Sigma x_n = x_1 + x_2 + \dots + x_n + \dots$ is an infinite

series where the terms may be +ve or -ve then

$s_n = x_1 + x_2 + \dots + x_n$ is called the n^{th} partial sum of Σx_n .

The n^{th} partial sum of an infinite series is

the sum of its first 'n' terms.

s_1, s_2, s_3, \dots are the first, second, third, ... partial sums of the series.

Since next, $\{s_n\}$ is a sequence of called the sequence of partial sums of the infinite series $\sum x_n$.

To every infinite series $\sum x_n$, there corresponds a sequence of $\{s_n\}$ of its partial sums.

Nature of infinite series:

(i) The series $\sum x_n$ is said to be cgs if the sequence of its partial sums cgs.

i.e., $\sum x_n$ is cgs if $\lim_{n \rightarrow \infty} s_n = l$ (finite)

(ii) If $\lim_{n \rightarrow \infty} s_n = +\infty$ (or) $-\infty$ then the series $\sum x_n$ is called dgs.

(iii) If the series $\sum x_n$ is neither cgs nor dgs, the series $\sum x_n$ is called oscillatory series.

→ The series $\sum x_n$ oscillates finitely if the sequence $\{s_n\}$ of its partial sums oscillates finitely.

i.e., $\sum x_n$ oscillates finitely if $\{s_n\}$ is bounded and neither cgs nor dgs.

→ The series $\sum x_n$ oscillates infinitely if the sequence $\{s_n\}$ of its partial sums oscillates infinitely.

i.e., $\sum x_n$ oscillates infinitely if $\{s_n\}$ is unbounded and neither cgs nor dgs.

Discuss the cgs and dgs.

$$(1) \sum_{n=1}^{\infty} x_n = \sum_{n=1}^{\infty} n$$
$$= 1+2+3+\dots+n+\dots$$

$$\text{Let } S_n = 1+2+\dots+n$$
$$= \frac{n(n+1)}{2}$$

$$\lim S_n = \infty$$

$\therefore \{S_n\}$ is dgtr to ∞

$\therefore \{x_n\}$ is dgtr to ∞ .

$$(2) \sum x_n = \sum n^2$$
$$= 1^2+2^2+\dots+n^2+\dots$$

$$\text{Let } S_n = 1^2+2^2+\dots+n^2$$

$$= \frac{n(n+1)(2n+1)}{6}$$

$$\lim S_n = +\infty$$

$\therefore \{S_n\}$ is dgtr.

$\therefore \{x_n\}$ is dgtr.

$$(3) \sum_{n=0}^{\infty} \frac{1}{3^n} = \frac{1}{3^0} + \frac{1}{3^1} + \frac{1}{3^2} + \dots + \frac{1}{3^{n-1}} + \frac{1}{3^n} + \dots$$

$$S_n = \frac{1}{3^0} + \frac{1}{3^1} + \frac{1}{3^2} + \dots + \frac{1}{3^{n-1}}$$

$$= 1 + \frac{1}{3} + \frac{1}{3^2} + \dots + \frac{1}{3^{n-1}}$$

$$= \frac{1(1-\frac{1}{3^n})}{1-\frac{1}{3}}$$

$$= \frac{3}{2} \left(1 - \frac{1}{3^n}\right)$$

$$\lim S_n = 3/2$$

$\therefore \{S_n\}$ is Cgt.

$\therefore \{x_n\}$ is Cgt.

$$\sum_{n=1}^{\infty} \frac{1}{2^n}$$

$$\sum_{n=1}^{\infty} k (\text{constant}) = k + k + \dots + k + \dots$$

$$S_n = k + k + \dots + k. \quad (n \text{ terms})$$

$$= nk.$$

$$\therefore S_n = \infty$$

$\therefore \{S_n\}$ is dgt.

\therefore The series $\sum n$ is dgt.

Note: Every constant sequence is cgt but the constant series is dgt.

$$\sum_{n=1}^{\infty} \frac{1}{n(n+1)} = \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \dots + \frac{1}{n(n+1)} + \dots$$

$$\begin{aligned} \text{Let } S_n &= \frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \frac{1}{3 \cdot 4} + \dots + \frac{1}{n(n+1)} \\ &= \left(\frac{1}{1} - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \dots + \left(\frac{1}{n} - \frac{1}{n+1}\right) \\ &\quad + \left(\frac{1}{n} - \frac{1}{n+1}\right) \\ &= 1 - \frac{1}{n+1} \end{aligned}$$

$$\therefore S_n = 1 - 0$$

$$\therefore \lim_{n \rightarrow \infty} = 1$$

$\therefore \{S_n\}$ is cgt to 1

$\therefore \sum n$ is cgt to 1.

Arithmetic Series:-

$$\sum n = a + (a+d) + (a+2d) + \dots + (a+(n-1)d) + \dots$$

$$\text{Let } S_n = a + (a+d) + (a+2d) + \dots + (a+(n-1)d)$$

$$S_n = \frac{n}{2}[2a + (n-1)d]$$

$$\therefore S_n = \infty$$

$\therefore \{S_n\}$ is dgt.

$\therefore \sum n$ is dgt.

Geometric series

$$\sum_{n=0}^{\infty} r^n = 1 + r + r^2 + \dots + r^{n-1} + \dots$$

(i) CGS if $-1 < r < 1$ i.e. $|r| < 1$

(ii) DGS if $r > 1$

(iii) oscillates finitely if $r = -1$

(iv) oscillates infinitely if $r > 1$.

so] Let $s_n = 1 + r + r^2 + \dots + r^{n-1}$

then $s_n = \frac{1-r^n}{1-r}$

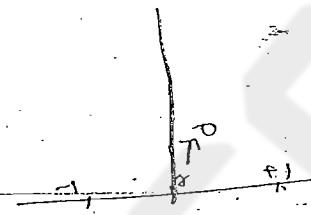

(i) if $-1 < r < 1$ i.e. $|r| < 1$

$$\therefore r^n \rightarrow 0 \text{ as } n \rightarrow \infty$$

$$\lim_{n \rightarrow \infty} s_n = \lim_{n \rightarrow \infty} \frac{1-r^n}{1-r} = \frac{1}{1-r} \text{ (finite number)}$$

$\therefore \{s_n\}$ is CGT.

$\therefore \sum r^n$ is CGT.

(ii) If $r > 1$

sub case (i): If $r = 1$

$$\text{then } s_n = 1 + 1 + \dots + 1 \text{ (n terms)}$$

$$= n(1)$$

$$= n$$

$$\text{now } \lim_{n \rightarrow \infty} s_n = \infty$$

$\therefore \{s_n\}$ is DGT $\Rightarrow \sum r^n$ is DGT.

sub case (ii): If $r > 1$

$$\text{i.e. } 1 < r \rightarrow \infty$$

$$\therefore r^n \rightarrow \infty \text{ as } n \rightarrow \infty$$

$$\begin{aligned} \lim_{n \rightarrow \infty} s_n &= \lim_{n \rightarrow \infty} \frac{1-r^n}{1-r} \text{ or } \lim_{n \rightarrow \infty} \frac{r^n}{r-1} \\ &= +\infty \text{ or } -\infty \end{aligned}$$

$\therefore \{s_n\}$ is DGT.

$\sum r^n$ is DGT.

(iii) If $r \leq -1$

$$\text{then } s_n = \begin{cases} 0 & \text{if } n \text{ is even} \\ 1 & \text{if } n \text{ is odd} \end{cases}$$

$$\therefore L + s_n = \begin{cases} 0 & \text{if } n \text{ is even} \\ 1 & \text{if } n \text{ is odd} \end{cases}$$

$\therefore \{s_n\}$ is oscillatory seq.

$\therefore \sum s_n$ is oscillatory series.

This oscillatory series is finite.
oscillatory series.

(iv) If $r < -1$ then $-r > 1$

$\Rightarrow r > 1$ where $x = -r$.

$\Rightarrow 1 < x^n \rightarrow \infty$ as $n \rightarrow \infty$

i.e. $(-r)^n \rightarrow \infty$ as $n \rightarrow \infty$.

$$\therefore s_n = \frac{(1 - (-r)^n)}{1 - (-r)} = \frac{1 - (-r)^n}{1 + r}$$

$$= \begin{cases} \frac{1 + r^n}{1 + r} & \text{if } n \text{ is odd} \\ \frac{1 - r^n}{1 + r} & \text{if } n \text{ is even} \end{cases}$$

$$\text{Now } L + s_n = \begin{cases} +\infty & \text{if } n \text{ is odd} \\ -\infty & \text{if } n \text{ is even.} \end{cases}$$

\therefore the series s_n is oscillating series.
This oscillates infinitely.

Note: (1) The g.s. egs only when common ratio is numerically less than 1.

(2) In an infinite series, if the terms are changed, a finite number of terms are added (or) omitted and each term of the series is multiplied and divided by the fixed numbers 'k' then the nature of the series does not change.

Problems

→ The geometric Series

$$\sum_{n=0}^{\infty} r^n = 1 + r + r^2 + \dots + r^{n-1} + \dots$$

(i) Converges if $-1 < r < 1$, i.e. $|r| < 1$

(ii) Diverges if $r \geq 1$

(iii) Oscillates finitely if $r = 1$

(iv) Oscillates infinitely if $r < -1$.

→ P-test (or) P-Series:

The series $\sum \frac{1}{n^p}$

$$= \frac{1}{1^p} + \frac{1}{2^p} + \dots + \frac{1}{n^p}$$

(i) Converges if $p > 1$

(ii) Diverges if $p \leq 1$.

→ The n^{th} term Test:

If the series $\sum x_n$ converges

then $\lim_{n \rightarrow \infty} (x_n) = 0$.

Note!— (1) $\sum x_n$ converges $\Rightarrow \lim x_n = 0$

(2) $\lim x_n = 0 \Rightarrow \sum x_n$ may (con) may not converge.

(3) $\lim x_n \neq 0 \Rightarrow \sum x_n$ is not convergent.

(4) The series $\sum_{n=1}^{\infty} \frac{1}{n}$ is called the harmonic series.

→ A positive term series either converges (or) diverges to ∞ .

→ If $x_n > 0 \forall n$ and $\lim_{n \rightarrow \infty} x_n \neq 0$ then $\sum x_n$ diverges to ∞ .

→ Comparison Test: Let $x = (x_n)$ and $y = (y_n)$ be non-negative

Sequences of real numbers and suppose that for some $K \in \mathbb{N}$, we have

$$0 \leq x_n \leq y_n \text{ for } n \geq K.$$

Then

(a) The convergence of $\sum y_n \Rightarrow$ the convergence of $\sum x_n$.

(b) The divergence of $\sum x_n \Rightarrow$ the divergence of $\sum y_n$.

Limit Comparison Test:

Suppose that $x = (x_n)$ and $y = (y_n)$ are strictly +ve sequences and suppose that the following limit exists in \mathbb{R} :

$$\gamma = \lim_{n \rightarrow \infty} \left(\frac{x_n}{y_n} \right).$$

(a) If $\gamma \neq 0$ (finite) then $\sum x_n$ is convergent (or divergent) iff $\sum y_n$ is convergent (or divergent).

(b) If $\gamma = 0$ and if $\sum y_n$ is convergent then $\sum x_n$ is convergent.

(c) If $\gamma = \infty$ and if $\sum y_n$ diverges then $\sum x_n$ diverges.

Problems

→ The series $\sum_{n=1}^{\infty} \frac{1}{n^2+n}$ converges.

Sol'n— Clearly the inequality.

$$0 < \frac{1}{n^2+n} < \frac{1}{n^2} \quad \forall n$$

∴ which is in the form of $0 < x_n < y_n$

$$\text{where } x_n = \frac{1}{n^2+n} \quad \& \quad y_n = \frac{1}{n^2}.$$

Now $\sum y_n = \sum \frac{1}{n^2}$ is of the form

$$\sum \frac{1}{n^p} \text{ where } p = 2 > 1$$

\therefore By P-Test.

$\sum y_n$ is convergent.

\therefore By Comparison Test

$\sum x_n$ is convergent.

\therefore (Or)

$$\text{Let } \bar{x}_n = \frac{1}{n^2+n} = \frac{1}{n^2(1+\frac{1}{n})}$$

$$\text{Let } y_n = \frac{1}{n^2}$$

$$\text{then } \frac{x_n}{y_n} = \frac{1}{1+y_n}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{x_n}{y_n} = 1 \neq 0.$$

Since $\sum y_n = \sum \frac{1}{n^2}$ is convergent

by P-Test.

\therefore By Comparison test

$\sum x_n$ is convergent.

Now the series $\sum_{n=1}^{\infty} \frac{1}{n^2-n+1}$ is

convergent.

→ The series $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n+1}}$ is divergent.

* By using partial fractions,

Show that

$$@ \sum_{n=0}^{\infty} \frac{1}{(n+1)(n+2)} = 1$$

$$(b) \sum_{n=0}^{\infty} \frac{1}{(\alpha+n)(\alpha+n+1)} = \frac{1}{\alpha} > 0 \quad \text{if } \alpha > 0$$

$$\textcircled{c} \quad \sum_{n=1}^{\infty} \frac{1}{n(n+1)(n+2)} = \frac{1}{4}$$

$$\text{sol'n: (a) Let } x_n = \frac{1}{(n+1)(n+2)} = \frac{1}{n+1} - \frac{1}{n+2}$$

\therefore The n th partial sum

$$S_n = x_0 + x_1 + \dots + x_{n-1}$$

$$= (1 - \frac{1}{2}) + (\frac{1}{2} - \frac{1}{3}) + (\frac{1}{3} - \frac{1}{4})$$

$$\dots \dots \left(\frac{1}{n} - \frac{1}{n+1} \right)$$

$$= 1 - \frac{1}{n+1}$$

$\therefore \lim S_n = 1$

$$\therefore \sum x_n = 1$$

$$\textcircled{b} \quad \text{Let } x_n = \frac{1}{(\alpha+n)(\alpha+n+1)}$$

$$= \frac{1}{\alpha+n} - \frac{1}{\alpha+n+1}$$

$$\therefore S_n = x_0 + x_1 + \dots + x_{n-1}$$

$$= \left(\frac{1}{\alpha} - \frac{1}{\alpha+1} \right) + \left(\frac{1}{\alpha+1} - \frac{1}{\alpha+2} \right) +$$

$$\dots \dots + \left(\frac{1}{\alpha+n-1} - \frac{1}{\alpha+n} \right)$$

$$= \frac{1}{\alpha} - \frac{1}{\alpha+n}$$

$\therefore \lim S_n = \frac{1}{\alpha} > 0 \text{ if } \alpha > 0$

$$\textcircled{c} \quad \text{Let } x_n = \frac{1}{n(n+1)(n+2)}$$

$$= \frac{1}{2n} - \frac{1}{n+1} + \frac{1}{2(n+2)}$$

$$\therefore S_n = x_1 + x_2 + \dots + x_{n-1} + x_n$$

→ Discuss the Convergence or divergence of the following series.

$$\textcircled{1} \quad \sqrt{\frac{1}{4}} + \sqrt{\frac{2}{6}} + \sqrt{\frac{3}{8}} + \dots + \sqrt{\frac{n}{2(n+1)}} + \dots$$

$$\textcircled{2} \quad \frac{1}{\sqrt{1 \cdot 2}} + \frac{1}{\sqrt{2 \cdot 3}} + \frac{1}{\sqrt{3 \cdot 4}} + \dots$$

$$\underline{\text{sol'n}}: \text{ Let } \sum x_n = \sum \sqrt{\frac{n}{2(n+1)}}$$

$$= \sqrt{\frac{1}{4}} + \sqrt{\frac{2}{6}} + \dots + \sqrt{\frac{n}{2(n+1)}}$$

$$\text{Here } x_n = \sqrt{\frac{n}{2(n+1)}} + \dots$$

$$= \sqrt{\frac{1}{2(1+k_n)}}$$

$$\therefore \lim x_n = \lim \frac{1}{\sqrt{2(1+k_n)}}$$

$$= \frac{1}{\sqrt{2}} \neq 0$$

$$\therefore \lim x_n \neq 0$$

since $x_n > 0 \forall n$ and $\lim x_n \neq 0$.

$\therefore \sum x_n$ diverges to ∞ .

(Q) Given that

$$\frac{1}{\sqrt{1 \cdot 2}} + \frac{1}{\sqrt{2 \cdot 3}} + \frac{1}{\sqrt{3 \cdot 4}} + \dots = \sum \frac{1}{\sqrt{n(n+1)}}$$

$$\text{Let } x_n = \frac{1}{\sqrt{n(n+1)}} + \dots$$

$$= \frac{1}{n} \left(\frac{1}{1+\frac{1}{n}} \right)$$

$$\text{Let } y_n = \frac{1}{n}$$

$$\text{then } \frac{x_n}{y_n} = \frac{1}{1+k_n}$$

$$\therefore \lim \frac{x_n}{y_n} = 1 \neq 0$$

Since $\sum y_n = \sum \frac{1}{n}$ is divergent.
(by P-test)

∴ By Comparison test the series

$\sum x_n$ is divergent.

$$\textcircled{3} \quad \frac{1}{1^P} + \frac{3}{2^P} + \frac{4}{3^P} + \frac{5}{4^P} + \dots$$

$$\underline{\text{sol'n}}: \text{ Let } x_n = \frac{n+1}{n^P}$$

$$= \frac{1}{n^{P-1}} (1+k_n)$$

$$\text{Let } y_n = \frac{1}{n^{P-1}}$$

$$\text{then } \frac{x_n}{y_n} = 1+k_n.$$

$$\therefore \lim_{n \rightarrow \infty} \left(\frac{x_n}{y_n} \right) = 1 \neq 0.$$

Since $\sum y_n = \sum \frac{1}{n^{P-1}}$ is convergent.

if $P-1 > 1$

i.e., $P > 2$

∴ By Comparison test

$\sum x_n$ is convergent.

also $\sum y_n = \sum \frac{1}{n^{P-1}}$ is divergent.

if $P-1 \leq 1$

i.e., $P \leq 2$

∴ By Comparison test

$\sum x_n$ is divergent.

$$\text{H.W. } \sum (3(n+1))^{-1}$$

$$\rightarrow \sum (n+1)^{-2}$$

$$\rightarrow \frac{(n+1)^{-1}}{n^4+1}$$

$$\rightarrow \frac{1}{n^P(n+1)^{P-1}}$$

$$\sum (\sqrt{n^3+1} - \sqrt{n^3})$$

Sol'n: Let $x_n = \sqrt{n^3+1} - \sqrt{n^3}$

$$= (\sqrt{n^3+1} - \sqrt{n^3}) \times \frac{\sqrt{n^3+1} + \sqrt{n^3}}{\sqrt{n^3+1} + \sqrt{n^3}}$$

$$\frac{n^3+1 - n^3}{\sqrt{n^3+1} + \sqrt{n^3}}$$

$$= \frac{1}{\sqrt{n^3+1} + \sqrt{n^3}}$$

$$= \frac{1}{n^{3/2}(1 + \sqrt{1 + \frac{1}{n^3}})}$$

$$\text{Let } y_n = \frac{1}{n^{3/2}}$$

$$\text{then } \frac{x_n}{y_n} = \frac{1}{1 + \sqrt{1 + \frac{1}{n^3}}}$$

$$\therefore \lim \frac{x_n}{y_n} = \frac{1}{2} \neq 0.$$

Since $\sum y_n = \sum \frac{1}{n^{3/2}}$ is convergent

by P-test. Here $P = \frac{3}{2} > 1$

\therefore By comparison test

$\sum x_n$ is convergent.

$$\rightarrow \sum (\sqrt{n^2+1} - n)$$

$$\rightarrow \sum (\sqrt{n^4+1} - n^2)$$

$$\rightarrow \sum (3\sqrt{n} - \sqrt{n})$$

Sol'n: Let $x_n = \sqrt{n^3+1} - \sqrt{n^3}$

$$= (\sqrt{n+1})^{\frac{1}{3}} - n^{\frac{1}{3}}$$

$$= n^{\frac{1}{3}} \left[\left(1 + \frac{1}{n} \right)^{\frac{1}{3}} - 1 \right]$$

$$= n^{\frac{1}{3}} \left[\left(1 + \frac{1}{n} \right)^{\frac{1}{3}} - 1 \right] \cdot \frac{1}{n^{\frac{2}{3}}} \cdot n^{\frac{2}{3}}$$

$$= n^{\frac{1}{3}} \left[\left(1 + \frac{1}{3n} + \frac{1}{9n^2} + \dots \right)^{\frac{1}{3}} - 1 \right]$$

$$= n^{\frac{1}{3}} \left[\frac{1}{3n} - \frac{1}{9n^2} + \dots \right]$$

$$= \frac{1}{n^{2/3}} \left[\frac{1}{3} - \frac{1}{9n} + \dots \right]$$

$$\text{Let } y_n = \frac{1}{n^{2/3}}$$

$$\text{then } \frac{x_n}{y_n} = \frac{1}{3} - \frac{1}{9n} + \dots$$

$$\therefore \lim \frac{x_n}{y_n} = \frac{1}{3} \neq 0.$$

since $\sum y_n = \sum \frac{1}{n^{2/3}}$ is divergent

by P-test where $P = \frac{2}{3} < 1$

\therefore By comparison test

$\sum x_n$ is divergent.

$$\rightarrow \sum (3\sqrt{n} - n)$$

Note:

Rationalisation is effective only if square roots are involved where as this method of binomial expansion is general.

\rightarrow Test the convergence of the series.

(a) $\sum \sin \frac{1}{n}$ (b) $\sum \frac{1}{n} \sin \frac{1}{n}$

(c) $\sum \frac{1}{\sqrt{n}} \sin \frac{1}{n}$ (d) $\sum \cos \frac{1}{n}$

(e) $\sum \tan^{-1} \frac{1}{n}$ (f) $\sum \cot^{-1} n^2$

(g) $\sum \frac{1}{\sqrt{n}} \tan \frac{1}{n}$

Sol'n: (a) $\sum \sin \frac{1}{n}$

$$\text{Let } a_n = \sin \frac{1}{n}$$

$$\text{and let } y_n = \frac{1}{n}$$

$$\text{then } \lim_{n \rightarrow \infty} \frac{a_n}{y_n} = \lim_{n \rightarrow \infty} \frac{\sin \frac{1}{n}}{\frac{1}{n}}$$

$$\begin{aligned} &= \lim_{k_n \rightarrow 0} \frac{\sin k_n}{y_n} \\ &= 1 \\ &\neq 0 \end{aligned}$$

since $\sum y_n = \sum \frac{1}{n}$ is divergent
by P-Test where $P=1$.

\therefore By Comparison Test
 $\sum x_n$ is divergent.

(e). Let $x_n = \frac{1}{n} \sin \frac{1}{n}$

$$\text{Let } y_n = \frac{1}{n^2}$$

$$\text{then } \lim_{n \rightarrow \infty} \frac{x_n}{y_n} = \lim_{n \rightarrow \infty} \frac{\sin \frac{1}{n}}{\frac{1}{n^2}} = 1 \neq 0.$$

since $\sum y_n = \sum \frac{1}{n^2}$ is convergent
by P-Test where $P=2>1$.

\therefore By Comparison test $\sum x_n$ is convergent.

(f). Let $x_n = \frac{1}{\sqrt{n}} \sin \frac{1}{n}$

$$\text{Let } y_n = \frac{1}{n^{3/2}}$$

(g). Let $x_n = \cos \frac{1}{n}$

$$= 1 - \frac{(y_n)^2}{2!} + \frac{(y_n)^4}{4!} -$$

$$+ \frac{(y_n)^6}{6!} - \dots$$

$$= 1 - \frac{1}{n^2 \cdot 2!} + \frac{1}{n^4 \cdot 4!} -$$

$$\text{Let } y_n = \frac{1}{n}$$

$$\text{then } \frac{x_n}{y_n} = n - \frac{1}{n \cdot 2!} + \frac{1}{n^3 \cdot 4!} -$$

$$\therefore \lim_{n \rightarrow \infty} \frac{x_n}{y_n} = \infty$$

since $\sum y_n = \sum \frac{1}{n}$ is divergent
(by P-Test)

\therefore By comparison test $\sum x_n$ is divergent.
(or)

$$\lim_{n \rightarrow \infty} x_n = \lim_{n \rightarrow \infty} \cos \frac{1}{n} =$$

$$= 1 \neq 0.$$

since $\sum x_n$ is a series of +ve terms.
i.e., $x_n > 0 \forall n$.

and $\lim x_n \neq 0$.

$\therefore \sum x_n$ is divergent.

(e). Let $x_n = \tan^{-1} \frac{1}{n}$

$$= \frac{1}{n} - \frac{1}{2n^3} + \frac{1}{5n^5} - \frac{1}{7n^7} + \dots$$

$$\begin{aligned} (\text{f}) \quad \text{Let } x_n &= \cot^{-1} n^2 \\ &= \tan^{-1} \left(\frac{1}{n^2} \right) \end{aligned}$$

$\because \cot^{-1} x = 0$
 $\Rightarrow x = \cot 0$
 $\Rightarrow x = \frac{1}{\tan 0}$
 $\Rightarrow \tan 0 = \frac{1}{n^2}$
 $\Rightarrow 0 = \tan^{-1} \left(\frac{1}{n^2} \right)$

(g). Let $x_n = \frac{1}{\sqrt{n}} \tan^{-1} \left(\frac{1}{n} \right)$

$$\text{Let } y_n = \frac{1}{n^{3/2}}$$

$$\rightarrow \sum \frac{1}{n^{1/2} y_n}.$$

Sol'n - Let $x_n = \frac{1}{n \cdot n^{1/2}}$

$$\text{let } y_n = \frac{1}{n} \text{ then } \frac{x_n}{y_n} = \frac{1}{n^{1/2}}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{x_n}{y_n} = \lim_{n \rightarrow \infty} \frac{1}{n^{1/2}} = \frac{1}{1} = 1$$

since $\sum y_n = \sum \frac{1}{n}$ is divergent by
P-Test

\therefore By comparison test
 $\sum x_n$ is divergent.

D'Alembert's Ratio Test:

If $\sum u_n$ is a series of the terms such that (i) If $\frac{u_n}{u_{n+1}} = l$ then

(i) $\sum u_n$ converges if $l > 1$,

(ii) $\sum u_n$ diverges if $l < 1$,

(iii) $\sum u_n$ may converge or diverge if $l = 1$.

(ie. the test fails if $l = 1$)

Notice: In general the ratio test is applied when

Fractions & combination of powers involved.

Discuss the Convergence of the following Series:

$$1 + \frac{2!}{2^2} + \frac{3!}{3^3} + \frac{4!}{4^4} + \dots$$

Sol'n:- Let $u_n = \frac{n!}{n^n}$ then

$$u_{n+1} = \frac{(n+1)!}{(n+1)^{n+1}}$$

$$\text{Now } \frac{u_n}{u_{n+1}} = \frac{n!}{n^n} \times \frac{(n+1)^{n+1}}{(n+1)!}$$

$$= \frac{n(1+k_n)^{n+1}}{(n+1)^{n+1}}$$

$$= (1+k_n)^n$$

$$\therefore \lim \frac{u_n}{u_{n+1}} = \lim (1+k_n)^n$$

$$= e > 1$$

∴ By D'Alembert's Ratio test.

$\sum u_n$ is convergent.

$$\rightarrow \frac{1 \cdot 2^2}{1!} + \frac{2^2 \cdot 3^2}{2!} + \frac{3^2 \cdot 4^2}{3!} + \dots$$

$$\text{Sol'n:- Let } u_n = \frac{n^2(n+1)^2}{n!}$$

$$\text{then } u_{n+1} = \frac{(n+1)^2(n+2)^2}{(n+1)!}$$

$$\rightarrow (n+1)^4$$

$$\therefore \frac{u_n}{u_{n+1}} = \frac{n^2(n+1)^2}{n!} \times \frac{(n+1)!}{(n+1)^2(n+2)^2}$$

$$= \frac{(n+1)}{\left(1 + \frac{2}{n}\right)^2}$$

$$= n \cdot \frac{(1+k_n)}{(1+\frac{2}{n})^2}$$

$$\therefore \lim \left(\frac{u_n}{u_{n+1}} \right) = \infty > 1$$

∴ By D'Alembert's Ratio test

$\sum u_n$ is convergent.

$$\rightarrow \frac{2}{1^2+1} + \frac{2^2}{2^2+1} + \frac{2^3}{3^2+1} + \dots$$

$$\text{Sol'n:- Let } u_n = \frac{2^n}{n^2+1}$$

$$\text{then } u_{n+1} = \frac{2^{n+1}}{(n+1)^2+1}$$

$$\text{Now } \frac{u_n}{u_{n+1}} = \frac{2^n}{n^2+1} \times \frac{(n+1)^2+1}{2^{n+1}}$$

$$= \frac{1}{2} \frac{(1+k_n)^2 + k_n}{(1+k_{n+1})^2}$$

$$\therefore \lim \frac{u_n}{u_{n+1}} = \frac{1}{2} < 1$$

∴ By D'Alembert's ratio test

$\sum u_n$ is divergent.

$$\rightarrow \sum \frac{x^n}{3^n \cdot n^2}, x > 0.$$

$$\text{Sol'n:- Let } u_n = \frac{x^n}{3^n \cdot n^2}$$

$$\text{then } u_{n+1} = \frac{x^{n+1}}{3^{n+1} \cdot (n+1)^2}$$

$$\therefore \frac{u_n}{u_{n+1}} = \frac{x^n}{3^n \cdot n^2} \times \frac{3^{n+1} \cdot (n+1)^2}{x^{n+1}}$$

$$= \frac{3}{x} (1 + \ln)^2$$

$$\text{Now } \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = \frac{3}{x}$$

\therefore By D'Alembert's test

$\sum u_n$ converges if $3/x > 1$

$$\text{i.e. } x < 3$$

and diverges if $3/x < 1$ i.e. $x > 3$.

if $x = 3$ then $\lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = 1$

\therefore Ratio Test fails.

Now if $x = 3$, $u_n = \frac{3^n}{3^n \cdot n^2} = \frac{1}{n^2}$

$\therefore \sum u_n = \sum \frac{1}{n^2}$ is convergent by P-test.

$\therefore \sum u_n$ is convergent if $x \leq 3$

and divergent if $x > 3$.

$$\rightarrow \sum \frac{x^n}{a + \sqrt{n}} : x > 0$$

$$\rightarrow \sum \frac{n!}{n^{3/2}} \cdot x^n : x > 0$$

$$\rightarrow 1 + \frac{x^2}{2} + \frac{x^4}{4} + \frac{x^6}{6} + \dots : x > 0.$$

Sol'n :- Let, $u_n = \frac{x^n}{2^n}$ (leaving the first term)

$$\text{then } u_{n+1} = \frac{x^{n+1}}{2^{n+1}}$$

$$\therefore \frac{u_n}{u_{n+1}} = \frac{1}{x} (1 + \ln)$$

$$\therefore \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = \frac{1}{x^2}$$

\therefore By D'Alembert's ratio test

$\sum u_n$ is convergent.

$$\text{if } \frac{1}{x^2} > 1$$

i.e. $x^2 < 1$

i.e. if $x < 1$

and the series diverges.

if $\frac{1}{x^2} < 1$

i.e. $x^2 > 1$

i.e. $x > 1$

If $x^2 = 1$ i.e. $x = 1$, then the ratio test fails.

if $x = 1$ then $u_n = \frac{1}{2^n}$

Let $v_n = \frac{1}{n}$ then

$$\frac{u_n}{v_n} = \frac{1}{2^n}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \frac{1}{2} \neq 0.$$

Since $\sum v_n = \sum \frac{1}{n}$ is divergent by P-test.

\therefore By comparison test $\sum u_n$ is divergent.

$\therefore \sum u_n$ is divergent.

$$\text{if } x \geq 1$$

and $\sum u_n$ is convergent if $x < 1$.

* Final note: Root test :-

\rightarrow If $\sum u_n$ is a series of positive terms

such that

(i) $\lim_{n \rightarrow \infty} (u_n)^{1/n} = l$ then

(ii) $\sum u_n$ converges if $l < 1$.

(iii) $\sum u_n$ diverges if $l > 1$.

(iv) $\sum u_n$ may converge or diverge if $l = 1$.

(i.e. the test fails if $l = 1$).

(b) If $\lim_{n \rightarrow \infty} (u_n)^{1/n} = \infty$ then $\sum u_n$ is

divergent.

Note : The root test is used when powers are involved.

Problems :

* Test the convergence of the following series:

$$\rightarrow (a) \sum_{n=1}^{\infty} \left(\frac{n}{n+1} \right)^{n^2}$$

$$(b) \sum_{n=1}^{\infty} \frac{x^n}{n^n}$$

$$(c) \sum_{n=2}^{\infty} \frac{1}{(\log n)^n}$$

$$(d) \sum_{n=1}^{\infty} n^n, x > 0 \quad (e) \sum_{n=1}^{\infty} \left(\frac{n+1}{3n} \right)^n$$

$$\text{Sol'n} : (a) \text{ Let } x_n = \left(\frac{n}{n+1} \right)^{n^2}$$

$$\text{then } (x_n)^{1/n} = \left[\left(\frac{n}{n+1} \right)^{n^2} \right]^{1/n}$$

$$= \left(\frac{n}{n+1} \right)^n$$

$$= \left(\frac{n+1}{n} \right)^{-n}$$

$$= \left[\left(1 + \frac{1}{n} \right)^{+n} \right]^{-1}$$

$$\text{Now } \lim_{n \rightarrow \infty} (x_n)^{1/n} = e^{-1}$$

$$= \frac{1}{e} < 1$$

∴ By Cauchy's root test

$\sum x_n$ converges.

$$(b) \text{ Let } x_n = \frac{1}{(\log n)^n}$$

$$\text{then } x_n^{1/n} = \frac{1}{\log n}$$

$$\therefore \lim_{n \rightarrow \infty} x_n^{1/n} = \lim_{n \rightarrow \infty} \frac{1}{\log n} = 0 < 1.$$

∴ By root test.

$\sum x_n$ is convergent.

$$\rightarrow \sum 5^{-n} (-1)^n$$

$$\text{Sol'n} : \text{ Let } x_n = 5^{-n} (-1)^n$$

$$\text{then } (x_n)^{1/n} = 5^{-1} \cdot \frac{(-1)^n}{n}$$

$$= 5^{-1 - \frac{1}{n}} \text{ if } n \text{ is even}$$

$$= 5^{-1 + \frac{1}{n}} \text{ if } n \text{ is odd.}$$

$$\therefore \lim_{n \rightarrow \infty} x_n^{1/n} = 5^{-1}$$

$$= \frac{1}{5} < 1$$

∴ By root test

$\sum x_n$ is convergent.

$$\rightarrow \sum_{n=2}^{\infty} \frac{1}{[\log(\log n)]^n}$$

$$\rightarrow \sum_{n=1}^{\infty} 3^{-2n-5} (-1)^n$$

Note :- Cauchy's root test is more general than D'Alembert's ratio test.

because:

$$(i) \text{ If } \lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} \text{ exists} \Rightarrow \lim_{n \rightarrow \infty} u_n^{1/n} \text{ exists.}$$

$$\text{and } \lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} = \lim_{n \rightarrow \infty} u_n^{1/n}$$

(Cauchy's second theorem on limits)

∴ whenever ratio test is applicable, so is the root test.

$$(ii) \text{ If } \lim_{n \rightarrow \infty} u_n^{1/n} \text{ exists, then}$$

$$\lim_{n \rightarrow \infty} \frac{u_{n+1}}{u_n} \text{ may not exist.}$$

∴ when the ratio test fails the root test succeeds.

\therefore The root test is more general than the ratio test.

\rightarrow show that Cauchy's root test establishes the convergence of the series $\sum 3^{-n} - (-1)^n$

while D'Alembert's ratio test fails to do so.

$$\text{Sol'n: Let } u_n = 3^{-n} - (-1)^n$$

$$\begin{aligned} \text{then } \lim_{n \rightarrow \infty} \sqrt[n]{u_n} &= \lim_{n \rightarrow \infty} \sqrt[n]{3^{-n} - (-1)^n} \\ &= 3^{-1} \\ &= \frac{1}{3} < 1 \end{aligned}$$

\therefore By root test $\sum u_n$ is convergent.

Now if n is odd (so that $n+1$ is even)

$$u_n = 3^{-n+1}, u_{n+1} = 3^{-(n+1)-1}$$

$$\begin{aligned} &= 3^{-n-2} \\ \therefore \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} &= \lim_{n \rightarrow \infty} \frac{3^{-n+1}}{3^{-n-2}} \\ &= \lim_{n \rightarrow \infty} \left(\frac{3^1}{3^{-2}} \right) \end{aligned}$$

$$\begin{aligned} &= 3^3 \\ &= 27 > 1 \end{aligned}$$

when n is even

(so that $n+1$ is odd)

$$u_n = 3^{-n-1}, u_{n+1} = 3^{-n}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = 3^1 = \frac{1}{3} < 1.$$

$\therefore \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}}$ does not exist.

\therefore D'Alembert's ratio test fails.

* Raabe's Test

If $\sum u_n$ is a series of +ve terms

such that

$$\lim_{n \rightarrow \infty} n \left(\frac{u_n}{u_{n+1}} - 1 \right) = l \text{ then}$$

(i) $\sum u_n$ converges if $l > 1$.

(ii) $\sum u_n$ diverges if $l < 1$.

(iii) the test fails if $l=1$.

Note! - Raabe's test is stronger than D'Alembert's ratio test and may succeed where the ratio test fails.

For example:

$$\sum \frac{1}{n^2}$$

$$\text{Let } u_n = \frac{1}{n^2}$$

$$u_{n+1} = \frac{1}{(n+1)^2}$$

$$\begin{aligned} \therefore \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} &= \lim_{n \rightarrow \infty} \frac{(n+1)^2}{n^2} \\ &= \lim_{n \rightarrow \infty} \left(1 + \frac{1}{n} \right)^2 \\ &= 1 \end{aligned}$$

Here $l=1$,

\therefore the ratio test fails.

$$\text{But } \lim_{n \rightarrow \infty} n \left(\frac{u_n}{u_{n+1}} - 1 \right) = \lim_{n \rightarrow \infty} n \left[\left(1 + \frac{1}{n} \right)^2 - 1 \right]$$

$$= \lim_{n \rightarrow \infty} n \left[\frac{(n+1)^2 - 1}{n^2} \right]$$

$$\lim_{n \rightarrow \infty} n \left[\frac{x^n + 1 + 2n - x^n}{n^2} \right] = \lim_{n \rightarrow \infty} n \left(\frac{1}{n} + 2 \right) = 2 > 1$$

∴ By Raabe's test.

$\sum u_n$ is convergent.

Note:-

① If $\lim_{n \rightarrow \infty} n \left(\frac{u_n}{u_{n+1}} - 1 \right) = \infty$ then

$\sum u_n$ is convergent.

② If $\lim_{n \rightarrow \infty} n \left(\frac{u_n}{u_{n+1}} - 1 \right) = -\infty$ then

$\sum u_n$ is divergent.

③ In general Raabe's test is used when D'Alembert's ratio test fails and the ratio $\frac{u_n}{u_{n+1}}$ does not involve the number 'e'.

→ when $\frac{u_n}{u_{n+1}}$ involves 'e' we apply

logarithmic test after the ratio test and not Raabe's test.

* Logarithmic Test

If $\sum u_n$ is a series of five terms such that $\lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = l$

then (i) $\sum u_n$ converges if $l > 1$

(ii) $\sum u_n$ diverges if $l < 1$

(iii) the test fails if $l = 1$.

$$\text{Sol'n: Let } u_n = \frac{n^n \cdot x^n}{n!}$$

$$\text{then } u_{n+1} = \frac{(n+1)^{n+1} \cdot x^{n+1}}{(n+1)!}$$

$$\therefore \frac{u_n}{u_{n+1}} = \frac{n^n \cdot x^n}{n!} \times \frac{(n+1)!}{(n+1)^{n+1} \cdot x^{n+1}}$$

$$= \frac{(n+1) \cdot n^n}{(n+1)^{n+1} \cdot x}$$

$$= \frac{1}{(1+\frac{1}{n})^n} \cdot \frac{1}{x}$$

$$\text{Now } \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = \frac{1}{e^x}$$

∴ By D'Alembert's test, the series $\sum u_n$ converges if $\frac{1}{e^x} > 1$.

i.e. $e^x < 1$

i.e. $x < \frac{1}{e}$

and diverges if $\frac{1}{e^x} < 1$

i.e. $e^x > 1$

i.e. $x > \frac{1}{e}$

If $x = \frac{1}{e}$ then the ratio test fails.

Now if $x = \frac{1}{e}$ then $\frac{u_n}{u_{n+1}} = \frac{1}{(1+\frac{1}{n})^n} e$

Since $\frac{u_n}{u_{n+1}}$ involves the number 'e'

∴ we apply the logarithmic test.

$$\text{Now } \log \left(\frac{u_n}{u_{n+1}} \right) = \log \left[\frac{1}{(1+\frac{1}{n})^n} e \right]$$

$$= \log e - n \log \left(1 + \frac{1}{n} \right)$$

$$= 1 - n \left[\frac{1}{n} - \frac{1}{2n^2} + \frac{1}{3n^3} - \dots \right]$$

$$= \frac{1}{2n} - \frac{1}{3n^2} + \dots$$

$$\therefore \lim_{n \rightarrow \infty} n \log \frac{u_n}{u_{n+1}}$$

$$= \lim_{n \rightarrow \infty} n \left[\frac{1}{2n} - \frac{1}{3n^2} + \dots \right]$$

$$= \frac{1}{2} < 1$$

\therefore By logarithmic test
the series $\sum u_n$ is divergent.

$\therefore \sum u_n$ is divergent if $x \geq \frac{1}{e}$ and
converges if $-x < \frac{1}{e}$.

→ Discuss the convergence of
the series.

$$1 + \frac{1}{2} nx + \frac{1 \cdot 3}{2 \cdot 4} x^2 + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} x^3 + \dots \quad (x > 0)$$

Solⁿ :- Neglecting the first term,

$$\text{let } u_n = \frac{1 \cdot 3 \cdot 5 \dots (2n-1)}{2 \cdot 4 \cdot 6 \dots (2n)} x^n$$

$$u_{n+1} = \frac{1 \cdot 3 \cdot 5 \dots (2n-1)(2n+1)}{2 \cdot 4 \cdot 6 \dots (2n)(2n+2)} x^{n+1}$$

$$\text{Now } \frac{u_n}{u_{n+1}} = \frac{2n+2}{2n+1} \cdot \frac{1}{x} = \frac{1+\frac{1}{2n}}{1+\frac{1}{2n}} \cdot \frac{1}{x}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = \frac{1}{x}$$

\therefore By Ratio test $\sum u_n$ converges if $\frac{1}{x} > 1$

i.e. $x < 1$ & diverges if $\frac{1}{x} < 1$ i.e. $x > 1$

If $x = 1$ then the ratio fails.

$$\text{but when } x = 1, \frac{u_n}{u_{n+1}} = \frac{2n+2}{2n+1}$$

Clearly which is not involving in e.
so we apply the Raabe's test.

$$n \left(\frac{u_n}{u_{n+1}} - 1 \right) = \frac{n}{2n+1} = \frac{1}{2+\frac{1}{n}} \quad ?$$

$$\text{Now } \lim_{n \rightarrow \infty} n \left(\frac{u_n}{u_{n+1}} - 1 \right) = \frac{1}{2} < 1.$$

\therefore By Raabe's Test, $\sum u_n$ is divergent.

Hence $\sum u_n$ is Convergent if $x \leq 1$

and divergent if $x \geq 1$.

2008 → Discuss the convergence of the

$$\text{series } \frac{x}{2} + \frac{x^3}{2 \cdot 4} + \frac{x^5}{2 \cdot 4 \cdot 6} + \dots + \frac{x^{2n-1}}{2 \cdot 4 \cdot 6 \cdots (2n)} \quad (x > 0)$$

Gauss' Test :-

If $\sum u_n$ is a series of positive
terms such that $\frac{u_n}{u_{n+1}} = 1 + \frac{1}{n} + \frac{\alpha_n}{n^{1+\delta}}$

where $\delta > 0$ and (α_n) is a bounded
sequence, then

(i) $\sum u_n$ converges if $\lambda > 1$

(ii) $\sum u_n$ diverges if $\lambda \leq 1$.

Note ! -

(1) the test never fails as we know
that the series diverges for $\lambda = 1$.
moreover, the test is applied after
the failure of Ratio test and when
it is possible to expand $\frac{u_n}{u_{n+1}}$ in powers
of $\frac{1}{n}$ by Binomial Theorem (or) by
any other method.

(2) Raabe's Test (or) Gauss' Test. If

$\frac{u_n}{u_{n+1}}$ does not involve the number e.

(i) If $\frac{u_n}{u_{n+1}}$ involves the number e , apply logarithmic test.

(ii) For application of Gauss test,

expand $\frac{u_n}{u_{n+1}}$ in powers of $\frac{1}{n}$:

$$\frac{u_n}{u_{n+1}} = 1 + \frac{\lambda}{n} + O\left(\frac{1}{n^2}\right) \text{ where}$$

$O\left(\frac{1}{n^2}\right)$ stands for terms of order $\frac{1}{n^2}$ and higher powers of $\frac{1}{n}$.

* De Morgan's and Bertrand's Test

If $\sum u_n$ is a series of positive terms such that

$$\lim_{n \rightarrow \infty} \left[\left\{ n \left(\frac{u_n}{u_{n+1}} - 1 \right) - 1 \right\} \log n \right] = l$$

then (1) $\sum u_n$ converges if $l > 1$.

(2) $\sum u_n$ diverges if $l < 1$.

Note! - This test is to be applied when both D'Alembert's ratio test and Raabe's test fails.

* An alternative to Bertrand's Test:

If $\sum u_n$ is a series of positive terms such that

$$\lim_{n \rightarrow \infty} \left[\left(n \log \frac{u_n}{u_{n+1}} - 1 \right) \log n \right] = l$$

then (1) $\sum u_n$ converges if $l > 1$.

(2) $\sum u_n$ diverges if $l < 1$.

Note! - This test is to be applied when the logarithmic test fails.

Problems :-

$$\rightarrow \frac{1}{2} + \frac{1 \cdot 3}{2 \cdot 4} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} + \dots$$

$$\text{Let } u_n = \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2 \cdot 4 \cdot 6 \cdots 2n}$$

$$\text{Then } u_{n+1} = \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)(2n+1)}{2 \cdot 4 \cdot 6 \cdots (2n)(2n+2)}$$

$$\therefore \frac{u_n}{u_{n+1}} = \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2 \cdot 4 \cdot 6 \cdots 2n} \times \frac{2 \cdot 4 \cdot 6 \cdots (2n)(2n+2)}{1 \cdot 3 \cdot 5 \cdots (2n-1)(2n+1)} \\ = \frac{2n+2}{2n+1} = \frac{1 + \frac{1}{2n}}{1 + \frac{1}{2n}}$$

$$\text{Now if } \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = 1$$

i.e. D'Alembert's ratio test fails.

Now we apply the Raabe's test

$$\therefore n \left[\frac{u_n}{u_{n+1}} - 1 \right] = n \left[\frac{2n+2}{2n+1} - 1 \right]$$

$$\therefore = \frac{n}{2n+1} = \frac{1}{2 + \frac{1}{n}}$$

$$\therefore \lim_{n \rightarrow \infty} n \left[\frac{u_n}{u_{n+1}} - 1 \right] = \frac{1}{2} < 1$$

∴ By Raabe's test, $\sum u_n$ diverges.

$$\rightarrow \frac{1^2}{2^2} + \frac{1^2 \cdot 3^2}{2^2 \cdot 4^2} + \frac{1^2 \cdot 3^2 \cdot 5^2}{2^2 \cdot 4^2 \cdot 6^2} + \dots$$

$$\text{Sol'n: - Let } u_n = \frac{1^2 \cdot 3^2 \cdots (2n-1)^2}{2^2 \cdot 4^2 \cdots (2n)^2}$$

$$\text{then } u_{n+1} = \frac{1^2 \cdot 3^2 \cdots (2n-1)^2 (2n+1)^2}{2^2 \cdot 4^2 \cdots (2n)^2 (2n+2)^2}$$

$$\therefore \frac{u_n}{u_{n+1}} = \frac{(2n+2)^2}{(2n+1)^2} = \frac{\left(1 + \frac{1}{2n}\right)^2}{\left(1 + \frac{1}{2n}\right)^2}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = 1$$

\therefore D'Alembert's Ratio test fails

Now apply Raabe's test

$$\begin{aligned} \therefore n \left[\frac{u_n}{u_{n+1}} - 1 \right] &= n \left[\frac{(2n+2)^2}{(2n+1)^2} - 1 \right] \\ &= n \left[\frac{4n+3}{(2n+1)^2} \right] \\ &= \frac{4n^2 + 3n}{(2n+1)^2} \\ &= \frac{1 + \frac{3}{4n}}{\left(1 + \frac{1}{2n}\right)^2} \end{aligned}$$

$$\therefore \lim_{n \rightarrow \infty} n \left[\frac{u_n}{u_{n+1}} - 1 \right] = 1$$

\therefore Raabe's test fails.

Now we apply Gauss test

$$\begin{aligned} \therefore \frac{u_n}{u_{n+1}} &= \frac{(2n+2)^2}{(2n+1)^2} \\ &= \left(1 + \frac{1}{n}\right)^2 \left(1 + \frac{1}{2n}\right)^2 \end{aligned}$$

$$\begin{aligned} &= \left(1 + \frac{2}{n} + \frac{1}{n^2}\right) \left(1 - \frac{2}{2n} + \frac{3}{4n^2} - \dots\right) \\ &= \left(1 - \frac{2}{2n} + \frac{3}{4n^2} - \dots\right) + \left(\frac{2}{n} - \frac{4}{2n^2} + \frac{6}{4n^3} - \dots\right) \\ &\quad + \left(\frac{1}{n^2} - \frac{2}{2n^3} + \frac{3}{4n^4} - \dots\right) \\ &= 1 + \frac{1}{n} - \frac{1}{4n^2} + \dots \end{aligned}$$

$$= 1 + \frac{1}{n} + O\left(\frac{1}{n^2}\right)$$

Now comparing with

$$\frac{u_n}{u_{n+1}} = 1 + \frac{\lambda}{n} + O\left(\frac{1}{n^2}\right)$$

we have $\lambda = 1$

\therefore By Gauss Test

$\sum u_n$ is divergent.

Note: When D'Alembert's test fails then we may directly apply Gauss test

$$\rightarrow 1 + \frac{2}{3^2} + \frac{2 \cdot 4^2}{3^2 \cdot 5^2} + \frac{2^2 \cdot 4^2 \cdot 6^2}{3^2 \cdot 5^2 \cdot 7^2} + \dots$$

Sol'n :- Omitting the first term,

we have

$$u_n = \frac{2^2 \cdot 4^2 \cdot 6^2 \dots (2n)^2}{3^2 \cdot 5^2 \cdot 7^2 \dots (2n+1)^2}$$

$$\rightarrow 1 + \frac{3}{4} + \frac{3 \cdot 6}{4 \cdot 10} x^2 + \frac{3 \cdot 6 \cdot 9}{4 \cdot 10 \cdot 13} x^4 + \dots$$

Sol'n :- Leaving the first term,

we have

$$u_n = \frac{3 \cdot 6 \cdot 9 \dots (3n)}{7 \cdot 10 \cdot 13 \dots (3n+4)} x^n$$

$$\Rightarrow u_{n+1} = \frac{3 \cdot 6 \cdot 9 \dots (3n)(3n+3)}{7 \cdot 10 \cdot 13 \dots (3n+4)(3n+7)} x^{n+1}$$

$$\therefore \frac{u_n}{u_{n+1}} = \frac{3n+7}{3n+3} \cdot \frac{1}{x}$$

$$= \frac{1 + \frac{4}{3n}}{1 + \frac{1}{3n}} \cdot \frac{1}{x}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = \frac{1}{x}$$

\therefore By D'Alembert's Ratio test

$\sum u_n$ converges if $\frac{1}{x} > 1$
i.e. $x < 1$

and $\sum u_n$ diverges if $\frac{1}{x} < 1$
i.e. $x > 1$

If $x=1$ then, the ratio test fails.

$$\text{When } x=1, \frac{u_n}{u_{n+1}} = \frac{3n+7}{3n+3}$$

Now we apply Gauss test.

$$\begin{aligned}\therefore \frac{u_n}{u_{n+1}} &= \frac{3n+7}{3n+3} \\ &= \left(1 + \frac{7}{3n}\right) \left(1 + \frac{1}{n}\right)^{-1} \\ &= \left(1 + \frac{7}{3n}\right) \left(1 - \frac{1}{n} + \frac{1}{n^2} - \frac{1}{n^3} + \dots\right) \\ &= \left(1 - \frac{1}{n} + \frac{1}{n^2} - \dots\right) + \left(\frac{7}{3n} - \frac{7}{3n^2} + \dots\right) \\ &= 1 + \frac{4}{3n} - \frac{4}{3n^2} + \dots \\ &= 1 + \left(\frac{4}{3}\right) \frac{1}{n} + O\left(\frac{1}{n^2}\right)\end{aligned}$$

Comparing it with

$$\frac{u_n}{u_{n+1}} = 1 + \frac{\lambda}{n} + O\left(\frac{1}{n^2}\right)$$

$$\text{where } \lambda = \frac{4}{3} > 1$$

∴ By Gauss test,

$\sum u_n$ is Convergent.

∴ The given series converges if $x \leq 1$
and diverges if $x > 1$.

$$\begin{aligned}&\rightarrow \frac{x}{1} + \frac{1}{2} \cdot \frac{x^3}{3} + \frac{1 \cdot 3}{2 \cdot 4} \cdot \frac{x^5}{5} + \dots \\ &\quad \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} \cdot \frac{x^7}{7} + \dots\end{aligned}$$

Sol'n:— Neglecting the first term,
we have

$$u_n = \frac{1 \cdot 3 \cdot 5 \cdot 7 \dots (2n+1)}{2 \cdot 4 \cdot 6 \dots (2n)} \cdot \frac{x^{2n+1}}{(2n+1)}$$

* Cauchy's Condensation Test:

Let $\sum_{n=1}^{\infty} a(n)$ be such that $a(n)$)

i.e. a decreasing sequence of strictly positive numbers.

$\sum_{n=1}^{\infty} a(n)$ converges (or diverges) iff

$\sum_{n=1}^{\infty} 2^n a(2^n)$ converges (or diverges).

Problems:-

$$(i) \sum_{n=2}^{\infty} \frac{1}{\ln n} \quad (ii) \sum_{n=2}^{\infty} \frac{1}{n \ln n}$$

$$(iii) \sum_{n=3}^{\infty} \frac{1}{n(\ln n)(\ln \ln n)}$$

$$(iv) \sum_{n=4}^{\infty} \frac{1}{n(\ln n)(\ln \ln n)(\ln \ln \ln n)}$$

Sol'n:— (i) Here given that

$$\sum_{n=2}^{\infty} \frac{1}{\ln n} = \sum_{n=2}^{\infty} \frac{1}{\log n}$$

$$\text{Put } \sum_{n=2}^{\infty} a(n) = \sum_{n=2}^{\infty} \frac{1}{\log n}$$

$$\text{Here } a(n) = \frac{1}{\log n}$$

since $(\log n)$ is an increasing sequence.

$\therefore (a_n) = \left(\frac{1}{\log n}\right)$ is a decreasing sequence.

$$\begin{aligned} \sum_{n=2}^{\infty} 2^n a(2^n) &= \sum_{n=2}^{\infty} 2^n \frac{1}{\log(2^n)} \\ &= \sum_{n=2}^{\infty} 2^n \cdot \frac{1}{n \log 2} \\ &= \frac{1}{\log 2} \sum_{n=2}^{\infty} 2^n \cdot \frac{1}{n} \quad \text{--- (1)} \end{aligned}$$

$$\text{Let } v_n = \frac{2^n}{n}$$

$$\text{Then } v_n v_n = \frac{2}{n} v_n$$

$$\begin{aligned} \therefore \lim_{n \rightarrow \infty} v_n v_n &= \frac{2}{1} \\ &= 2 > 1 \end{aligned}$$

\therefore By Cauchy's root test,
 $\sum a_n$ is divergent.

$\therefore \sum_{n=2}^{\infty} 2^n a(2^n)$ is divergent.

\therefore By Cauchy's condensation test

$$\sum a_n = \sum \frac{1}{\ln n}$$

is divergent.

(ii) Given that

$$\sum_{n=2}^{\infty} \frac{1}{n \ln n} = \sum \frac{1}{n \log n}$$

$$\text{put } \sum a_n = \sum \frac{1}{n \log n}$$

$$\text{Here } a(n) = \frac{1}{n \log n}$$

since $(n \log n)$ is an increasing

sequence.

$\therefore (a_n) = \frac{1}{(n \log n)}$ is a decreasing sequence.

$$\begin{aligned} \sum_{n=2}^{\infty} 2^n a(2^n) &= \sum_{n=2}^{\infty} 2^n \frac{1}{2^n \log(2^n)} \\ &= \sum_{n=2}^{\infty} \frac{1}{n \log 2} \\ &= \frac{1}{\log 2} \sum_{n=2}^{\infty} \frac{1}{n} \end{aligned}$$

is divergent by P-Test where $P=1$.

\therefore By Cauchy's condensation test.

$$\sum a_n = \sum \frac{1}{n \ln n}$$

is divergent.

$$\begin{aligned} \text{(iii) Given } \sum_{n=3}^{\infty} \frac{1}{n(\ln n)(\ln \ln n)} &= \\ \sum_{n=3}^{\infty} \frac{1}{n(\log n)(\log \log n)} & \end{aligned}$$

$$\text{Put } \sum a_n = \sum \frac{1}{n(\log n)(\log \log n)}$$

$$\text{Here } a(n) = \frac{1}{n(\log n)(\log \log n)}$$

Since $(n(\log n)(\log \log n))$ is an increasing sequence.

$\therefore (a_n)$ is a decreasing sequence.

$$\begin{aligned} \sum 2^n a(2^n) &= \sum 2^n \frac{1}{2^n (\log 2)(\log \log 2)} \\ &= \sum \frac{1}{(\log 2) \log(\log 2)} \\ &= \sum x_n \text{ (say)} \quad \text{--- (A)} \end{aligned}$$

Since $\log 2 < 1$

$$\Rightarrow n \log_2 < n$$

$$\Rightarrow \log(n \log_2) < \log n$$

$$\Rightarrow \frac{1}{\log(n \log_2)} > \frac{1}{\log n}$$

$$\Rightarrow \frac{1}{n \log_2} \cdot \frac{1}{\log(n \log_2)} > \frac{1}{n \log n}$$

$$\Rightarrow x_n > \frac{1}{\log_2} \cdot \frac{1}{n \log n}$$

$$= y_n \text{ (say)} \quad \textcircled{B}$$

$$\therefore x_n > y_n \forall n$$

$$\text{i.e. } y_n < x_n \forall n \quad \textcircled{C}$$

$$\text{Since } \sum y_n = \sum \frac{1}{\log_2} \cdot \frac{1}{n \log n}$$

$$= \frac{1}{\log_2} \sum \frac{1}{n \log n}$$

diverges (by (ii))

∴ By comparison test,

$\sum x_n$ diverges.

∴ By Cauchy's Condensation test,

$\sum a(n)$ diverges.

(iv) Given that

$$\sum_{n=4}^{\infty} \frac{1}{n(\ln n)(\ln \ln n)(\ln \ln \ln n)}$$

$$= \sum_{n=4}^{\infty} \frac{1}{n(\log n)(\log \log n)(\log \log \log n)}$$

$$\text{Put } \sum_{n=4}^{\infty} a(n) =$$

$$\sum_{n=4}^{\infty} \frac{1}{n(\log n)(\log \log n)(\log \log \log n)}$$

$$\text{Here } a(n) = \frac{1}{n(\log n)(\log \log n)(\log \log \log n)}$$

Since $(n \log n)(\log \log n)(\log \log \log n)$ is an increasing sequence.

∴ $a(n)$ is a decreasing sequence.

$$\therefore \sum 2^n a(2^n) =$$

$$\sum 2^n \frac{1}{2^n (\log 2^n)(\log \log 2^n)(\log \log \log 2^n)}$$

$$= \sum \frac{1}{(n \log_2)(\log(n \log_2)(\log \log(n \log_2)))}$$

$$= \frac{1}{\log_2} \sum \frac{1}{n(\log n \log_2)(\log \log(n \log_2))}$$

$$= \sum x_n \text{ (say)}$$

Since $\log_2 < 1$

$$\Rightarrow \log n \log_2 < \log n \quad \textcircled{A}$$

$$\Rightarrow \log \log n \log_2 < \log \log n$$

$$\Rightarrow \frac{1}{\log \log n \log_2} > \frac{1}{\log \log n} \quad \textcircled{B}$$

$$\textcircled{A} \equiv$$

$$\frac{1}{\log n \log_2} > \frac{1}{\log n} \quad \textcircled{C}$$

$$\text{But } \frac{1}{n} = \frac{1}{n} \quad \textcircled{D}$$

from ①, ②, ③ give,

$$\frac{1}{n(\log n \log 2) \cdot (\log \log n \log 2)} > \frac{1}{n(\log n)(\log \log n)}$$

$= y_n$ say

$$\therefore x_n > y_n \quad \forall n$$

$$\text{i.e. } y_n < x_n \quad \forall n$$

But by ③,

$$\sum y_n = \sum \frac{1}{n(\log n)(\log \log n)}$$

diverges (by (iii))

\therefore By comparison test

$\sum x_n$ also diverges.

\therefore By Cauchy's Condensation test,

$\sum a(n)$ diverges.

If $c > 1$ then show that the following series are convergent.

$$\textcircled{a} \quad \sum \frac{1}{n(\log n)^c}$$

$$\textcircled{b} \quad \sum \frac{1}{n(\log n)(\log \log n)^c}$$

$$\underline{\text{Sol'n:}} \textcircled{a} \quad \sum a(n) = \sum \frac{1}{n(\log n)^c}$$

is decreasing for $c > 1$.

$$\therefore \sum 2^n a(2^n) = \sum 2^n \cdot \frac{1}{2^n (\log 2^n)^c}$$

$$= \sum \frac{1}{(n \log 2)^c}$$

$$= \frac{1}{(\log 2)^c} \sum \frac{1}{n^c}$$

12

Since $\sum \frac{1}{n^c}$ is convergent for $c > 1$.

$\therefore \sum 2^n a(2^n)$ is convergent.

\therefore By Cauchy's Condensation test,

$\sum a(n)$ is convergent.

$\therefore \sum \frac{1}{(\log n)^{\log n}}$ is convergent.

(ii) since $\lim_{n \rightarrow \infty} \log(\log \log n) = \infty$

\therefore we can find a n

so large that

$$\log(\log \log n) > 2$$

$$\Rightarrow \log n \cdot \log(\log \log n) > 2 \log n$$

$$\Rightarrow \log(\log \log n) \log n > \log n^2$$

$$\Rightarrow (\log \log n)^{\log n} > n^2$$

$$\Rightarrow \frac{1}{(\log \log n)^{\log n}} < \frac{1}{n^2}$$

since $\sum \frac{1}{n^2}$ is convergent.

\therefore By comparison test.

$\sum \frac{1}{(\log \log n)^{\log n}}$ is convergent.

(iii), since the multiplication of numbers is commutative.

$$\therefore \log \log r = \log \log r$$

$$\Rightarrow \log(r^{\log n}) = \log(n^{\log r})$$

$$\Rightarrow r^{\log n} = n^{\log r}$$

$$\therefore \sum r^{\log n} = \sum n^{\log r}$$

$$\therefore \sum \frac{1}{n^{\log r}}$$

By P-test it is convergent.

if $\log r > 1$

i.e. if $\log r < -1$

i.e. if $\log r < -\log e$

Comparison test :-

Note! Let $\sum u_n$ and $\sum v_n$ be two series of positive terms and let $k & k'$ be two real numbers such that
 $k u_n < v_n < k' u_n \quad \forall n$.

Then the series

$\sum u_n$ & $\sum v_n$ converge (or)
 diverge together.

\rightarrow Examine the following series for convergence.

$$(i) \sum \frac{1}{(\log n)^{\log n}} \quad (ii) \sum \frac{1}{(\log \log n)^{\log n}}$$

$$(iii) \sum r^{\log n}$$

Sol'n :- (i) Since $\lim_{n \rightarrow \infty} \log(\log n) = \infty$

\therefore we can find n

so large that $\log(\log n) > 2$

$$\log[\log(\log n)] > 2 \log n$$

$$\log(\log n)^{\log n} > \log n^2$$

$$\Rightarrow (\log n)^{\log n} > n^2$$

$$\Rightarrow \frac{1}{(\log n)^{\log n}} < \frac{1}{n^2} \quad \text{--- (1)}$$

Since $\sum \frac{1}{n^2}$ is convergent (by P-test)

i.e. if $\log r < \log e^1$

i.e. if $r < \frac{1}{e}$

$\sum r^{\log n}$ converges iff $r < \frac{1}{e}$.

* Alternating Series :-

A series with terms alternatively +ve and -ve is called an alternative series.
i.e. $u_1 - u_2 + u_3 - u_4 + \dots + (-1)^{n-1} u_n$
where $u_n > 0 \forall n$ is alternating series and is shortly written as

$$\sum_{n=1}^{\infty} (-1)^{n-1} u_n.$$

* Leibnitz's Test on Alternating Series:

The alternating series

$$\sum (-1)^{n-1} u_n = u_1 - u_2 + u_3 - u_4 + \dots, \\ u_n > 0 \forall n$$

Converges if i) $u_n \geq u_{n+1} \forall n$ and

$$\text{ii)} \lim_{n \rightarrow \infty} u_n = 0.$$

Note:- The alternating series will not be convergent if any one of the two conditions is not satisfied.

* Absolute and Conditional Convergence:

A series $\sum_{n=1}^{\infty} u_n$ is said to be absolutely convergent if the series

$$\sum_{n=1}^{\infty} |u_n|$$
 is convergent.

→ If $\sum_{n=1}^{\infty} u_n$ converges but not absolutely.

i.e. $\sum_{n=1}^{\infty} u_n$ diverges then the

series $\sum_{n=1}^{\infty} |u_n|$ is called conditional convergent (or) semi-convergent (or) non-absolutely convergent.

Note:- Every absolutely convergent series is convergent but convergent series need not be absolute convergent.

Ex:-

$$\sum \frac{(-1)^{n-1}}{n} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$$

Sol'n:- Let $u_n = \frac{1}{n}$

then $u_n > 0 \forall n$

Since $\frac{1}{n} > \frac{1}{n+1} \forall n$,

$$\Rightarrow u_n > u_{n+1} \forall n$$

$$\text{and } \lim_{n \rightarrow \infty} u_n = \lim_{n \rightarrow \infty} \frac{1}{n} = 0.$$

∴ By Leibnitz's test,

$$\sum \frac{(-1)^{n-1}}{n} \text{ convergent.}$$

But the series $\sum \left| \frac{(-1)^{n-1}}{n} \right|$ -

$$= \sum \frac{1}{n} \text{ is divergent.}$$

(by P-Test)

Problems:-

Test the convergence and absolute convergence of the series.

$$(i) 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots$$

Sol'n: The given series is

$$\sum u_n = \sum \frac{(-1)^{n-1}}{2n-1}$$

$$= \sum_{n=1}^{\infty} (-1)^{n-1} v_n$$

It is an alternating series.

$$\text{Here } v_n = \frac{1}{2n-1} > 0 \quad \forall n$$

$$v_{n+1} = \frac{1}{2n+1} \quad \forall n$$

$$\text{Since } 2n-1 < 2n+1 \quad \forall n$$

$$\frac{1}{2n-1} > \frac{1}{2n+1} \quad \forall n$$

$$\Rightarrow v_n > v_{n+1} \quad \forall n$$

$$\text{and If } v_n = 0, \quad n \rightarrow \infty$$

\therefore By Leibnitz's test, the series is convergent.

$$\text{Now } |u_n| = \frac{1}{2n-1}$$

$$\text{Since } \frac{1}{2n-1} > \frac{1}{2n} \quad \forall n$$

$$\therefore \sum \frac{1}{2n} = \frac{1}{2} \sum \frac{1}{n} \text{ is divergent (by P-test).}$$

\therefore By Comparison test,

$$\sum \frac{1}{2n-1} \text{ is divergent.}$$

$$\therefore \sum |u_n| \text{ is divergent.}$$

\therefore the series

$$\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{2n-1} \text{ is Conditional Convergent.}$$

$$\rightarrow \frac{1}{3} - \frac{1}{5} + \frac{1}{7} - \frac{1}{9} + \dots$$

$$\rightarrow \frac{1}{1 \cdot 3} - \frac{1}{2 \cdot 4} + \frac{1}{3 \cdot 5} - \frac{1}{4 \cdot 6} + \dots$$

Sol'n: The given series is

$$\sum v_n = \sum \frac{(-1)^{n-1}}{n(n+2)} = \sum (-1)^{n-1} v_n$$

It is an alternating series.

$$\rightarrow \frac{1}{\log 2} - \frac{1}{\log 3} + \frac{1}{\log 4} - \frac{1}{\log 5} + \dots$$

Sol'n: The given series is

$$\sum u_n = \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{\log(n+1)}$$

$$= \sum (-1)^{n-1} v_n$$

It is alternating series.

$$\text{Here } v_n = \frac{1}{\log(n+1)}$$

$$\text{and } v_{n+1} = \frac{1}{\log(n+2)}$$

$$\text{Since } (n+1) < (n+2) \quad \forall n$$

$$\log(n+1) < \log(n+2) \quad \forall n$$

$$\Rightarrow \frac{1}{\log(n+1)} > \frac{1}{\log(n+2)} \quad \forall n$$

$$\Rightarrow v_n > v_{n+1} \quad \forall n$$

$$\text{and If } v_n = \lim_{n \rightarrow \infty} \frac{1}{\log(n+1)}$$

$$= 0$$

\therefore By Leibnitz's test, the series is

Convergent.

$$\text{Now } |u_n| = \frac{1}{\log(n+1)}$$

$$\text{Since } \log(n+1) < (n+1) \quad \forall n$$

$$\Rightarrow \frac{1}{\log(n+1)} > \frac{1}{n+1} + u_n \quad (A)$$

Since $\sum \frac{1}{n+1} = \sum u_n$ (say)

$$\text{Let } a_n = \frac{1}{n+1} - \frac{1}{n(1+1/n)}$$

and $y_n = b_n$

$$\text{then } \frac{u_n}{y_n} = \frac{1}{(1+b_n)}$$

$$\therefore \lim \frac{u_n}{y_n} = 1 \neq 0.$$

Since $\sum y_n = \sum \frac{1}{n}$ is divergent

(by P-Test)

\therefore By Comparison test

$$\sum a_n = \sum \frac{1}{n+1}$$
 is divergent.

again by Comparison test

$$\sum |u_n| = \sum \frac{1}{\log(n+1)}$$
 is divergent.

$$\therefore \sum u_n = \sum \frac{(-1)^{n-1}}{n(n+1)}$$

is conditional convergent.

→ show that $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{2^n}{n!}$ is

absolutely convergent.

$$\text{Sol'n: } \sum_{n=1}^{\infty} |u_n| = \sum_{n=1}^{\infty} (-1)^{n+1} \frac{2^n}{n!}$$

$$|u_n| = \frac{2^n}{n!}, |u_{n+1}| = \frac{2^{n+1}}{(n+1)!}$$

$$\therefore \lim \left| \frac{u_n}{u_{n+1}} \right| = \lim \left(\frac{n+1}{2} \right) = \infty > 1$$

∴ By D'Alembert's ratio test,

$\sum |u_n|$ is convergent.

∴ The given alternating series is absolutely convergent.

Abel's Test:

If $\sum_{n=1}^{\infty} a_n$ is convergent and the sequence $\{b_n\}$ is monotonic and bounded, then $\sum_{n=1}^{\infty} a_n b_n$ is convergent.

Problem ①: Test the convergence of

$$\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n} (1+b_n)^n$$

Sol'n: Let $a_n = \frac{(-1)^{n-1}}{n}$ and

$$b_n = \left(1 + \frac{1}{n}\right)^n + n$$

Clearly $\sum a_n$ is convergent

(by Leibnitz's Test) and the sequence $\{b_n\}$ is monotone (increasing) and bounded.

Hence by Abel's Test,

the series $\sum_{n=1}^{\infty} a_n b_n$ is convergent.

Problem ②: Test the convergence of

$$1 - \frac{1}{3 \cdot 2^2} + \frac{1}{5 \cdot 3^2} - \frac{1}{7 \cdot 4^2} + \dots$$

$$\text{Sol'n: } 1 - \frac{1}{3 \cdot 2^2} + \frac{1}{5 \cdot 3^2} - \frac{1}{7 \cdot 4^2} + \dots$$

$$= \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n(2n-1)n^2}$$

$$\text{Let } a_n = \frac{(-1)^{n-1}}{n^2} \text{ and } b_n = \frac{1}{2n-1}$$

Problem: Show that the series

$$\sum_{n=2}^{\infty} \frac{(n^3+1)^{1/3} - n}{\log n}$$

Sol'n: Let $a_n = (n^3+1)^{1/3} - n$, $b_n = \frac{1}{\log n}$

then the series can be written as

$$\sum_{n=1}^{\infty} a_n b_n.$$

$$\text{Now } a_n = (n^3+1)^{1/3} - n = n \left(1 + \frac{1}{n^3}\right)^{1/3} - n$$

$$= n \left[1 + \frac{1}{3} \cdot \frac{1}{n^3} + \frac{1}{3} \cdot \frac{(-1)}{3!} \cdot \frac{1}{n^6} + \dots \right]$$

$$= \frac{1}{n^2} \left[\frac{1}{3} - \frac{1}{9n^3} + \dots \right]$$

$$\text{Take } c_n = \frac{1}{n^2} \text{ then}$$

$$\frac{a_n}{c_n} = \frac{1}{3} - \frac{1}{9n^3} + \dots$$

$$\text{As } \frac{a_n}{c_n} = \frac{1}{3} \text{ which is finite and non-zero.}$$

∴ By comparison test, $\sum a_n$ and $\sum c_n$ converge (or) diverge together.

But $\sum c_n = \sum \frac{1}{n^2}$ is convergent.

∴ $\sum a_n$ is convergent.

Also $\{b_n\}$ is a monotonically decreasing sequence of tve terms and bounded below.

∴ By Abel's test the series

$$\sum_{n=2}^{\infty} a_n b_n$$

Dirichlet's Test

If $\sum_{n=1}^{\infty} a_n$ is a series whose

Partial Sum $\{s_n\}$ is bounded

and $\{b_n\}$ is a monotonic sequence,

Converging to zero then $\sum_{n=1}^{\infty} a_n b_n$ is convergent.

→ Note: Leibnitz's Test as a particular

case of Dirichlet's Test!

The series $\sum_{n=1}^{\infty} (-1)^{n-1}$ has bounded partial sums,

$$\text{Since } s_n = \begin{cases} 1 & \text{if } n \text{ is odd} \\ 0 & \text{if } n \text{ is even} \end{cases}$$

If $\{a_n\}$ is a monotonically decreasing sequence of tve numbers convergent to '0' i.e. if (i) $a_n > 0$ then

$$(ii) a_n \geq a_{n+1} \forall n$$

$$(iii) a_n \rightarrow 0 \text{ as } n \rightarrow \infty$$

then by Dirichlet's test,

$$\text{the series } \sum_{n=1}^{\infty} (-1)^{n-1} a_n$$

i.e. the alternating series.

$a_1 - a_2 + a_3 - a_4 + \dots$ is convergent.

Problem: Discuss the convergence of

$$\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^p}, (p > 0)$$

Sol'n: Let $a_n = (-1)^{n-1}$ and $b_n = \frac{1}{n^p}$, $(p > 0)$

then the series $\sum a_n = \sum (-1)^{n-1}$

has bounded partial sums.

$$\text{Since } s_n = \begin{cases} 1 & \text{if } n \text{ is odd} \\ 0 & \text{if } n \text{ is even} \end{cases}$$

and the sequence $\{b_n\} = \left\{ \frac{1}{n^p} \right\} (p > 0)$

is monotonically decreasing sequence of tve numbers convergent to '0'.

i.e. (i) $b_n > 0 \forall n$

(ii) $b_n \geq b_{n+1} \forall n$

(iii) $b_n \rightarrow 0$ as $n \rightarrow \infty$

Hence by Dirichlet's Test $\sum_{n=1}^{\infty} a_n b_n$ is

Convergent.

* Rearrangement of Terms:

A series $\sum_{n=1}^{\infty} b_n$ is said to arise from a series $\sum_{n=1}^{\infty} a_n$ by a rearrangement of terms if there exists a one-to-one correspondence between the terms of the two series so that every a_n is some b_n and conversely.

for example, the series.

$$1 - \frac{1}{3} - \frac{1}{2} + \frac{1}{5} + \frac{1}{7} - \frac{1}{4} + \dots$$

is a rearrangement of series

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \dots$$

$$\text{i.e. } 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \dots$$

on rearranging the terms so that each positive term is followed by two negative terms,

the series

$$1 - \frac{1}{2} - \frac{1}{4} + \frac{1}{3} - \frac{1}{6} - \frac{1}{8} + \frac{1}{5} - \frac{1}{10} - \frac{1}{12} + \dots$$

If we add finitely many numbers, their sum has the same value, no matter how the terms of the sum are arranged. But this is not so when infinite series are involved. An

245

arrangement (or equally well derangements) or change in the order of the terms in an infinite series may not only alter the sum but may change its nature all together.

Dirichlet's Theorem (i):

(i) If $\sum_{n=1}^{\infty} a_n$ is a convergent series converging to 's', then any derangement $\sum_{n=1}^{\infty} a_n$ also converges to 's'.

(ii) If $\sum_{n=1}^{\infty} a_n$ is divergent positive term series then so also is $\sum_{n=1}^{\infty} b_n$.

Dirichlet's Theorem (ii):

If $\sum_{n=1}^{\infty} a_n$ is an absolutely convergent series then every derangement $\sum_{n=1}^{\infty} b_n$ also converges absolutely to the same sum as the original series.

* Riemann's Theorem:

A conditionally convergent series can be made by derangement of terms. (i) to converge to any real number.

- (ii) to diverge to any $+\infty$ or $-\infty$.
- (iii) to oscillate finitely or infinitely.

problem: ① Discuss the convergence of the series $1 + \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \frac{1}{5} + \frac{1}{6} - \dots$

sol'n: - the given series is a rearrangement of the series

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$$

which is absolutely convergent.

Hence by the Dirichlet's theorem, the given series is convergent.

Note: - Riemann's method is of theoretical importance only. For practical applications, the method given by Pringsheim's is useful. (Imp.)

Pringsheim's Method:

Let $f(n)$ be a tve fn decreasing to zero as $n \rightarrow \infty$. Then by

Leibnitz's test, the alternating series $\sum_{n=1}^{\infty} (-1)^{n-1} f(n)$ is convergent.

Let the terms of the series

$\sum_{n=1}^{\infty} (-1)^{n-1} f(n)$ be rearranged by

taking alternatively α positive terms and β negative terms.

If $g = m f(m)$, and $K = \alpha/\beta$.

then the alternation in the sum due to this rearrangement is

$\log K$.

In particular, if $f(n) = \frac{1}{n}$.

$$\text{then } \sum_{n=1}^{\infty} (-1)^{n-1} f(n) = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{1}{n} \\ = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$$

then we know that the series is Conditionally convergent and its sum is $\log 2$.

$$\text{Also } g = m f(m)$$

$$= m \cdot \frac{1}{m} = 1$$

∴ If the terms are rearranged by taking alternately α tve terms & β -ve terms,

then the sum of new series is

$$\log 2 + \frac{1}{2} g \log K = \log 2 + \frac{1}{2} \log K$$

Problems: ① Find the sum of the series

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \dots$$

Sol'n: The given series

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \dots$$

is rearrangement of the series

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \dots = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{1}{n}$$

and is Conditionally convergent and whose sum is $\log 2$.

Here the rearranged given series is formed by taking alternatively one tve and two -ve terms.

Let α be the tve terms & β be the -ve terms.

$$\text{then } K = \alpha/\beta = 1/2$$

$$\text{and } g = m f(m) = m \cdot \frac{1}{m} = 1$$

∴ the sum of the rearranged given series is $\log_2 + \frac{1}{2}g \log k$.

$$\begin{aligned}&= \log_2 + \frac{1}{2} \log k \\&= \log_2 - \frac{1}{2} \log_2 \\&= \underline{\underline{\frac{1}{2} \log_2}}.\end{aligned}$$

→ find the sum of the series.

(i) $1 + \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \frac{1}{5} + \frac{1}{6} - \frac{1}{7} + \frac{1}{8} - \dots$

(ii) $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \frac{1}{8} + \dots$

(iii) $1 + \frac{1}{2} + \frac{1}{3} - \frac{1}{4} - \frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8} - \frac{1}{9} - \frac{1}{10} + \dots$

→ Investigate what derangement of the series $1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \dots$

will reduce its sum to zero.

Sol'n: The given series is

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \dots = \sum (-1)^{n+1} \frac{1}{n}$$

It is conditionally convergent with sum \log_2 .

Let it be deranged by taking alternately α +ve & β -ve terms

$$\text{so that } k = \alpha/\beta.$$

$$\text{and } g = m f(m)$$

$$= m \cdot \frac{1}{m} = 1$$

∴ The sum of the deranged.

$$= \log_2 + \frac{1}{2}g \log k$$

$$= \log_2 + \frac{1}{2} \log k$$

But the sum is given to be zero.

$$\therefore \log_2 + \frac{1}{2} \log k = 0$$

$$\Rightarrow \frac{1}{2} \log k = -\log_2$$

$$\Rightarrow \log k = -2 \log_2$$

$$\Rightarrow \log k = \log \frac{1}{4}$$

$$\Rightarrow k = \frac{1}{4}$$

$$\Rightarrow \alpha/\beta = \frac{1}{4}$$

$$\Rightarrow \alpha = 1 \text{ (one +ve term)}$$

$$\beta = 4 \text{ (four -ve terms)}$$

∴ To get the sum zero, one +ve term should be followed by four -ve terms.

The deranged series.

$$\begin{aligned}&+ \frac{1}{2} - \frac{1}{3} + \frac{1}{4} - \frac{1}{5} + \frac{1}{6} - \frac{1}{7} + \frac{1}{8} - \frac{1}{9} + \frac{1}{10} - \frac{1}{11} - \frac{1}{12} - \frac{1}{13} + \dots \\&\quad + \frac{1}{5} + \dots\end{aligned}$$

H.W. what derangement of the

$$\text{series } 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \dots$$

will reduce its sum to $\frac{1}{2} \log_2$.

Ques: Rearrange the series.

H.W. $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{n}$ to converge to 1.

i.e. what derangement of the

series $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{1}{n}$ will reduce its

sum to 1.

Cauchy product of TWO infinite series !

If $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are two infinite series, then their product, called the Cauchy product, is defined,

$$\text{as } \sum_{n=1}^{\infty} c_n$$

where $c_n = a_1 b_n + a_2 b_{n-1} + a_3 b_{n-2} + \dots + a_n b_1$,

$$= \sum_{r=1}^n a_r b_{n-r+1} \text{ for each } n \in \mathbb{N}$$

$$\text{Thus } \sum_{n=1}^{\infty} c_n = \left(\sum_{n=1}^{\infty} a_n \right) \left(\sum_{n=1}^{\infty} b_n \right)$$

$$= (a_1 + a_2 + \dots) (b_1 + b_2 + \dots)$$

$$= a_1 b_1 + (a_1 b_2 + a_2 b_1) + (a_1 b_3 + a_2 b_2 + a_3 b_1) + \dots$$

$$= a_1 b_1 + a_1 b_2 + a_2 b_1 + a_2 b_2 + a_3 b_1 + a_3 b_2 + \dots$$

The terms in the product are so arranged

that all the terms which have the same sum of suffices are bracketed together.

Note:- (1) The Cauchy product of $\sum_{n=0}^{\infty} a_n$ and $\sum_{n=0}^{\infty} b_n$ is defined as $\sum_{n=0}^{\infty} c_n$.

where $c_n = a_0 b_n + a_1 b_{n-1} + a_2 b_{n-2} + \dots + a_n b_0$

$$= \sum_{r=0}^n a_r b_{n-r} \text{ for each } n \in \mathbb{N}$$

$$(2) c_n = \sum_{r=1}^n a_r b_{n-r+1} = \sum_{r=1}^n a_{n-r+1} b_r$$

$$\text{and } c_n = \sum_{r=0}^n a_r b_{n-r} = \sum_{r=0}^n a_n b_r$$

(3) If $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ converge then,

it is not necessary that $\sum_{n=1}^{\infty} c_n = \left(\sum_{n=1}^{\infty} a_n \right) \left(\sum_{n=1}^{\infty} b_n \right)$ must converge.

$\sum_{n=1}^{\infty} a_n$ converges if

(1) $\sum_{n=1}^{\infty} |a_n|$ and $\sum_{n=1}^{\infty} |b_n|$ are convergent series
of non-negative terms

(2)

(ii) $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are absolutely convergent
(or)

(iii) $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are convergent and
one of them is absolutely convergent.

i.e.

(i) If $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are two series of
non-negative terms converging to A and B
respectively then their Cauchy product $\sum_{n=1}^{\infty} c_n$
converges to AB.

(ii) If $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are two absolutely
convergent series such that $\sum_{n=1}^{\infty} a_n = A$ and
 $\sum_{n=1}^{\infty} b_n = B$ Then their Cauchy product $\sum_{n=1}^{\infty} c_n$
is also absolutely convergent and $\sum_{n=1}^{\infty} c_n = AB$.

(iii) Merten's Theorem

Let $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ be two convergent
series and let $\sum_{n=1}^{\infty} c_n$ converge absolutely.

If $\sum_{n=1}^{\infty} a_n = A$ and $\sum_{n=1}^{\infty} b_n = B$; then their
product $\sum_{n=1}^{\infty} c_n$ converges to AB.

→ Cesaro's Theorem:

If two sequences (a_n) and (b_n) converge to
'a' and 'b' respectively, then the sequence
 (x_n) where $x_n = \frac{a_1 b_1 + a_2 b_2 + \dots + a_n b_n}{n}$
converge to ab.

→ Abel's Test:- Let $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ be
two convergent series such that
 $\sum_{n=1}^{\infty} a_n = A$ and $\sum_{n=1}^{\infty} b_n = B$. If their Cauchy product
 $\sum_{n=1}^{\infty} c_n$ converges, then $\sum_{n=1}^{\infty} c_n = AB$.

problems

18

① S.T. the Cauchy product of the convergent series $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}$ w.r.t itself is not convergent.

Sol Given that $\sum_{n=1}^{\infty} (-1)^{n+1}$

$$\text{Let } a_n = b_n = \frac{(-1)^{n+1}}{n}, \forall n$$

\therefore By Leibnitz's test, the series $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are both convergent (but not absolutely).

the Cauchy's product of the two series is

$$\sum_{n=1}^{\infty} c_n$$

where

$$c_n = a_1 b_n + a_2 b_{n-1} + \dots + a_n b_1$$

$$= \frac{(-1)^0}{1} \cdot \frac{(-1)^{n+1}}{n} + \frac{(-1)^1}{2} \cdot \frac{(-1)^{n-1}}{n-1} + \dots + \frac{(-1)^{n-1}}{n} \cdot \frac{(-1)^0}{1}$$

$$= (-1)^{n+1} \left[\frac{1}{1 \cdot n} + \frac{1}{2 \cdot (n-1)} + \frac{1}{3 \cdot (n-2)} + \dots + \frac{1}{n \cdot 1} \right]$$

$$\geq (-1)^{n+1} \left[\frac{1}{n \cdot n} + \frac{1}{n \cdot n} + \dots + \frac{1}{n \cdot n} \right]$$

($\because r \leq n \Rightarrow \frac{1}{r} \geq \frac{1}{n}$)
here $r = 1, 2, \dots, n$

$$= (-1)^{n+1} \left[\frac{1}{n \cdot n} \cdot (n \text{ times}) \right]$$

$$= (-1)^{n+1} \left[\frac{n}{n \cdot n} \right]$$

$$= (-1)^{n+1} \left[\frac{1}{n} \right]$$

$$\therefore c_n \geq (-1)^{n+1} \left(\frac{1}{n} \right) \quad \forall n$$

$$\Rightarrow |c_n| \geq \left| (-1)^{n+1} \frac{1}{n} \right| \quad \forall n$$

$$\Rightarrow \frac{1}{n} \leq |c_n| \quad \forall n$$

Now $\sum_{n=1}^{\infty} \frac{1}{n}$ is divergent $\Rightarrow \sum_{n=1}^{\infty} |c_n|$ is divergent.

$\Rightarrow \lim_{n \rightarrow \infty} c_n \neq 0$ (by comparison)

Ans

Hence $\sum_{n=1}^{\infty} c_n$ can not converge.

Note:- The above example illustrates that the Cauchy product of two conditionally convergent series need not be necessarily convergent.

Q) Show that the Cauchy product of the convergent series $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{\sqrt{n}}$ with itself is not convergent.

Sol. Let $c_n = b_n = \frac{(-1)^{n+1}}{\sqrt{n}}, n \in \mathbb{N}$

By Leibnitz's test, the series $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are both convergent (but not absolutely).

The Cauchy product of the two series

is $\sum_{n=1}^{\infty} c_n$; where

$$c_n = a_1 b_n + a_2 b_{n-1} + \dots + a_n b_1$$

$$= \frac{(-1)^0 \cdot (-1)^{n+1}}{\sqrt{1}} + \frac{(-1)^1 \cdot (-1)^{n-2}}{\sqrt{2}} + \dots$$

$$= \dots + \frac{(-1)^{n+1}}{\sqrt{n}} \cdot \frac{(-1)^0}{\sqrt{1}}$$

$$= (-1)^{n+1} \left[\frac{1}{\sqrt{1 \cdot n}} + \frac{1}{\sqrt{2 \cdot (n-1)}} + \dots + \frac{1}{\sqrt{(n-1) \cdot 1}} \right]$$

$$\geq (-1)^{n+1} \left[\frac{1}{\sqrt{1 \cdot n}} + \frac{1}{\sqrt{2 \cdot n}} + \dots + \frac{1}{\sqrt{n \cdot 1}} \right]$$

$$= (-1)^{n+1} \left[\frac{1}{n} + \frac{1}{n} + \frac{1}{n} + \dots + \frac{1}{n} \right]$$

$$= (-1)^{n+1} \left[\frac{n}{n} \right]$$

$$= (-1)^{n+1}$$

$$\Rightarrow |c_n| \geq 1 \forall n \in \mathbb{N}$$

$$\Rightarrow \lim_{n \rightarrow \infty} c_n \neq 0.$$

Hence $\sum_{n=1}^{\infty} c_n$ cannot converge.

Q) Show that the Cauchy product of the convergent series $\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n+1}}$ with itself is not convergent. (19)

Sol Let $a_n = b_n = \frac{(-1)^n}{\sqrt{n+1}}$, $\forall n \in \mathbb{N}$.

By Leibnitz's test, the series $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are both convergent (but not absolutely).

The Cauchy product of the two series

is $\sum_{n=1}^{\infty} c_n$, where

$$\begin{aligned} c_n &= a_1 b_n + a_2 b_{n-1} + \dots + a_n b_1 \\ &= \frac{(-1)^1}{\sqrt{2}} \cdot \frac{(-1)^n}{\sqrt{n+1}} + \frac{(-1)^2}{\sqrt{3}} \cdot \frac{(-1)^{n-1}}{\sqrt{n}} + \dots + \frac{(-1)^n}{\sqrt{n+1}} \cdot \frac{(-1)^1}{\sqrt{2}} \\ &= (-1)^{n+1} \left[\frac{1}{\sqrt{2(n+1)}} + \frac{1}{\sqrt{3(n+1)}} + \dots + \frac{1}{\sqrt{(n+1)(n+1)}} \right] \\ &\geq (-1)^{n+1} \left[\frac{1}{\sqrt{(n+1)(n+1)}} + \frac{1}{\sqrt{(n+1)(n+1)}} + \dots + \frac{1}{\sqrt{(n+1)(n+1)}} \right] \\ &= (-1)^{n+1} \cdot \left(\frac{n}{n+1} \right). \end{aligned}$$

$$\therefore c_n \geq (-1)^{n+1} \left(\frac{n}{n+1} \right) = \text{non-FCN.}$$

$$|c_n| \geq \frac{n}{n+1}, \text{ given.}$$

Since $\sum_{n=1}^{\infty} \frac{n}{n+1}$ is divergent (By comparison test)

$\Rightarrow \sum_{n=1}^{\infty} |c_n|$ is divergent.

$$\Rightarrow \lim_{n \rightarrow \infty} c_n \neq 0.$$

Hence $\sum_{n=1}^{\infty} c_n$ cannot converge

Q) Show that the Cauchy product of two divergent series $\sum_{n=1}^{\infty} a_n = 2 + 2^2 + 2^3 + 2^4 + \dots$

and $\sum_{n=1}^{\infty} b_n = 1 + 1 + 1 + 1 + 1 + \dots$ is convergent.

so for $n \geq 2$,

$\sum a_n$ and $\sum b_n$ are geometric series
with common ratios 2 and 1 respectively.

Since the geometric series $\sum r^n$ is divergent

for $r \geq 1$.

i. the series $\sum a_n$ and $\sum b_n$ are both divergent.

The Cauchy product of the two gives

series is $\sum_{n=1}^{\infty} c_n$, where

$$\begin{aligned} c_n &= a_1 b_n + a_2 b_{n-1} + a_3 b_{n-2} + \dots + a_n b_1 \\ &= 2 \cdot 1 + 2 \cdot 1 + 2^2 \cdot 1 + 2^3 \cdot 1 + \dots \\ &\quad \dots + 2^{n-2} \cdot 1 + 2^{n-1} (-1) \\ &= 2 + (2 + 2^2 + 2^3 + \dots + 2^{n-2}) - 2^{n-1} \\ &= 2 + \frac{2(2^{n-2} - 1)}{2-1} - 2^{n-1} \left(\because \frac{2(2^{n-1})}{2-1} \right) \\ &= 2 + 2^{n-1} - 2 - 2^{n-1} \\ &= 0 \end{aligned}$$

$$\text{and } c_1 = a_1 b_1 \\ = 2(-1) \\ = -2$$

thus $\sum_{n=1}^{\infty} c_n = -2 + 0 + 0 + 0 + \dots$

clearly which cgs to -2

⑤ Show that the Cauchy product of two divergent

$$\text{series } \sum_{n=0}^{\infty} a_n = 1 - \frac{3}{2} - \left(\frac{3}{2}\right)^2 - \left(\frac{3}{2}\right)^3 - \dots$$

$$\text{and } \sum_{n=0}^{\infty} b_n = 1 + \left(2 + \frac{1}{2^2}\right) + \frac{3}{2} \left(2^2 + \frac{1}{2^3}\right) + \left(\frac{3}{2}\right) \left(2^3 + \frac{1}{2^4}\right) + \dots$$

is convergent.

Q1 for $\sum_{n=1}^{\infty} a_n$, $\sum a_n$ is a geometric series with common ratio $\frac{3}{2} (> 1)$.
 $\Rightarrow \sum a_n$ is divergent.

Also $\sum b_n$ is a series of positive terms and $b_n \neq 1$ for all
 since $\lim_{n \rightarrow \infty} b_n \neq 0$.

$\therefore \sum b_n$ is divergent.

The Cauchy product of the two given series

is $\sum_{n=0}^{\infty} c_n$, where

$$\begin{aligned} c_0 &= a_0 b_0 \\ &= 1 \times 1 \\ &= 1 \end{aligned}$$

and for $n \geq 1$,

$$\begin{aligned} c_n &= a_0 b_n + a_1 b_{n-1} + a_2 b_{n-2} + \dots + a_{n-1} b_1 + a_n b_0 \\ &= 1 \cdot \left(\frac{3}{2}\right)^{n-1} \left(2^n + \frac{1}{2^{n+1}}\right) - \left(\frac{3}{2}\right) \cdot \left(\frac{3}{2}\right)^{n-2} \left(2^{n-1} + \frac{1}{2^n}\right) \\ &\quad - \left(\frac{3}{2}\right) \cdot \left(\frac{3}{2}\right)^{n-3} \left(2^{n-2} + \frac{1}{2^{n-1}}\right) - \dots \\ &\quad - \left(\frac{3}{2}\right)^{n-1} \left(2 + \frac{1}{2^{n-1}}\right) - \left(\frac{3}{2}\right)^n \end{aligned}$$

$$\begin{aligned} &= \left(\frac{3}{2}\right)^{n-1} \left[\left(2^n + \frac{1}{2^{n+1}}\right) - \left(2^{n-1} + 2^{n-2} + \dots + 2\right) \right. \\ &\quad \left. - \left(\frac{1}{2^n} + \frac{1}{2^{n-1}} + \dots + \frac{1}{2^1}\right) \right] - \left(\frac{3}{2}\right)^n \end{aligned}$$

$$= \left(\frac{3}{2}\right)^{n-1} \left[2^{n-1} + \frac{1}{2^{n+1}} - \frac{2(2^{n-1}-1)}{2^1} - \frac{\frac{1}{2^n}(1-\frac{1}{2^{n-1}})}{1-\frac{1}{2}} \right] - \left(\frac{3}{2}\right)^n$$

$$= \left(\frac{3}{2}\right)^{n-1} \left[2^n + \frac{1}{2^{n+1}} - 2^n + 2 - \frac{1}{2} + \frac{1}{2^n} \right] - \left(\frac{3}{2}\right)^n$$

$$= \left(\frac{3}{2}\right)^{n-1} \left[\frac{3}{2} + \frac{1}{2^{n+1}} + \frac{1}{2^n} \right] - \left(\frac{3}{2}\right)^n$$

$$= \left(\frac{3}{2}\right)^{n-1} \left[\frac{3}{2} + \frac{3}{2^{n+1}} - \frac{3}{2} \right] = \frac{3^n}{2^{2n}} = \left(\frac{3}{4}\right)^n$$

$$\Rightarrow \sum_{n=0}^{\infty} a_n = \sum_{n=0}^{\infty} \left(\frac{3}{4}\right)^n$$

clearly which is a geometric series of positive terms with common ratio $\frac{3}{4} < 1$.
is absolutely convergent.

(6) \rightarrow S.T. the Cauchy product of two divergent series

$$\sum_{n=1}^{\infty} a_n = 1 + \frac{3}{2} + \left(\frac{3}{2}\right)^2 + \left(\frac{3}{2}\right)^3 + \dots$$

$$\text{and } \sum_{n=1}^{\infty} b_n = 1 + \left(2 + \frac{1}{2^n}\right) + \frac{3}{2} \left(2^2 + \frac{1}{2^{2n}}\right) + \left(\frac{3}{2}\right)^2 \left(2^3 + \frac{1}{2^{3n}}\right) + \dots$$

convergent

(Note: In example (6) a_n is the $(n+1)^{\text{th}}$ term of $\sum_{n=0}^{\infty} a_n$ whereas in example (6), a_n is the n^{th} term of $\sum_{n=0}^{\infty} a_n$).

\rightarrow prove that the Cauchy product of the two series $3 + \sum_{n=1}^{\infty} 3^n$ and $-2 + \sum_{n=1}^{\infty} 2^n$ is absolutely convergent, although both the series are divergent.

$$\text{Sol: Let } \sum_{n=0}^{\infty} a_n = 3 + 3 + 3^2 + 3^3 + \dots = 3 + \sum_{n=1}^{\infty} 3^n$$

$$\text{and } \sum_{n=0}^{\infty} b_n = -2 + 2 + 2^2 + 2^3 + \dots = -2 + \sum_{n=1}^{\infty} 2^n$$

\rightarrow Show that

$$\left(1 - \frac{1}{2} + \frac{1}{3} - \dots\right)^2 = \sum_{n=1}^{\infty} (-1)^{n+1} \left[\frac{1}{1 \cdot n} + \frac{1}{2(n-1)} + \dots + \frac{1}{n \cdot 1} \right]$$

$$\text{Sol: Let } 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots = \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} = \sum_{n=1}^{\infty} a_n,$$

then $\sum_{n=1}^{\infty} a_n$ converges (conditionally).

By Abel's test, if the Cauchy product $\sum_{n=1}^{\infty} c_n$ of $\sum_{n=1}^{\infty} a_n$ with itself converges,

(21)

$$\text{then } \left(\sum_{n=1}^{\infty} a_n \right)^2 = \sum_{n=1}^{\infty} c_n \quad \text{--- (1)}$$

Now,

$$\begin{aligned} c_n &= 1 \cdot \frac{(-1)^{n+1}}{n} \left[\frac{1}{2} + \frac{(-1)^{n-2}}{n-1} + \dots + \frac{(-1)^{n-2}}{2} \left(-\frac{1}{2} \right) + \frac{(-1)^n}{n} \cdot 1 \right] \\ &= (-1)^{n+1} \left[\frac{1}{1 \cdot n} + \frac{1}{2(n-1)} + \dots + \frac{1}{(n-1) \cdot 2} + \frac{1}{n \cdot 1} \right] \quad \text{--- (2)} \\ &= \frac{(-1)^{n+1}}{n+1} \left[\frac{n+1}{1 \cdot n} + \frac{n+1}{2(n-1)} + \dots + \frac{n+1}{(n-1) \cdot 2} + \frac{n+1}{n \cdot 1} \right] \\ &= \frac{(-1)^{n+1}}{n+1} \left[\left(1 + \frac{1}{n} \right) + \left(\frac{1}{2} + \frac{1}{n-1} \right) + \dots + \left(\frac{1}{n-1} + \frac{1}{2} \right) + \left(\frac{1}{n} + 1 \right) \right] \\ &= \frac{(-1)^{n+1}}{n+1} \left[2 + \frac{2}{2} + \dots + \frac{2}{n-1} + \frac{2}{n} \right] \\ &= (-1)^{n+1} \frac{2}{n+1} \left[1 + \frac{1}{2} + \dots + \frac{1}{n-1} + \frac{1}{n} \right] \\ \therefore |c_n| &= \frac{2}{n+1} \left[1 + \frac{1}{2} + \dots + \frac{1}{n} \right] \\ &= \frac{2n}{n+1} \left[\frac{1 + \frac{1}{2} + \dots + \frac{1}{n}}{n} \right] \\ &= \frac{2}{1 + \frac{1}{n}} \left[\frac{1 + \frac{1}{2} + \dots + \frac{1}{n}}{n} \right] \rightarrow 0 \text{ as } n \rightarrow \infty \end{aligned}$$

(by Cauchy's first theorem on limits)

$$\begin{aligned} \text{Also } |c_{n+1}| - |c_n| &= \frac{2}{n+2} \left(1 + \frac{1}{2} + \dots + \frac{1}{n} + \frac{1}{n+1} \right) \\ &\quad - \frac{2}{n+1} \left(1 + \frac{1}{2} + \dots + \frac{1}{n} \right) \\ &= \left(\frac{2}{n+2} - \frac{2}{n+1} \right) \left(1 + \frac{1}{2} + \dots + \frac{1}{n} \right) + \frac{2}{(n+2)(n+1)} \\ &= \frac{-2}{(n+2)(n+1)} \left(1 + \frac{1}{2} + \dots + \frac{1}{n} - 1 \right) \\ &= \frac{-2}{(n+2)(n+1)} \left(\frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} \right) < 0 \end{aligned}$$

$$\Rightarrow |c_n| > |c_{n+1}|$$

∴ By Leibnitz's test, the alternating series

$$\sum_{n=1}^{\infty} c_n = \sum_{n=1}^{\infty} (-1)^{n-1} \left[\frac{1}{1 \cdot n} + \frac{1}{2(n-1)} + \dots + \frac{1}{n \cdot 1} \right] \quad (\text{by Q})$$

Converges.

Hence, from (1), we have

$$\left(1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots\right)^2 = \sum_{n=1}^{\infty} (-1)^{n-1} \left[\frac{1}{1 \cdot n} + \frac{1}{2(n-1)} + \dots + \frac{1}{n \cdot 1} \right]$$

H.W Show that

$$\left(1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots\right)^2 = 2 \left[\frac{1}{2} - \frac{1}{3} (1 + \frac{1}{2}) + \frac{1}{4} (1 + \frac{1}{2} + \frac{1}{3}) - \frac{1}{5} (1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}) + \dots \right]$$

H.W Show that

$$\frac{1}{2} \left(1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots\right)^2 = \frac{1}{2} - \frac{1}{4} (1 + \frac{1}{3}) + \frac{1}{6} (1 + \frac{1}{2} + \frac{1}{3}) -$$

* Infinite products :-

(92)

If (a_n) is a sequence, then the product $a_1 a_2 a_3 \dots a_n \dots$ is called an infinite product.

and is denoted by $\prod_{n=1}^{\infty} a_n$ or simply by $\prod a_n$
 i.e. $\prod a_n = a_1 a_2 a_3 \dots a_n \dots$

a_n is called the n^{th} factor of the product.

The product of first 'n' terms of the sequence (a_n) is called the n^{th} partial product and is denoted by P_n .

$$\therefore \text{this } P_n = a_1 a_2 a_3 \dots a_n \\ = \prod_{r=1}^n a_r$$

The sequence (P_n) is called the sequence of partial products of the sequence (a_n) .

* convergence of infinite products :

Let $P_n = \prod_{r=1}^n a_r$ be the n^{th} partial product of the infinite product $\prod_{n=1}^{\infty} a_n$.

(i) If no factor a_n is 'zero', then the product $\prod_{n=1}^{\infty} a_n$ converges if the sequence (P_n) converges to a non-zero finite number P (say),

i.e. if $\lim_{n \rightarrow \infty} P_n = P$, then P is called the value of the product and we write $\prod a_n = P$.

If $\lim_{n \rightarrow \infty} P_n = \infty$ then the product $\prod_{n=1}^{\infty} a_n$ is

said to diverge to ∞ .

If $\lim_{n \rightarrow \infty} P_n = 0$, then the product $\prod_{n=1}^{\infty} a_n$ is said to diverge to '0'.

(i) If infinitely many factors a_n are zero, then the product $\prod_{n=1}^{\infty} a_n$ is said to diverge to 0.

(ii) If finitely many factors a_n are zero, then the product $\prod_{n=1}^{\infty} a_n$ is said to converge if it converges when the zero factors are removed.

(iii) If a finite number of factors are negative, then there exists a positive integer m such that $a_n > 0 \forall n \geq m$ and the product $\prod_{n=1}^{\infty} a_n$ is said to converge if the product $\prod_{n=m+1}^{\infty} a_n$ converges.

(iv) If the sequence (P_n) oscillates, then the product $\prod_{n=1}^{\infty} a_n$ is said to oscillate.

Note: (1) It is usually convenient to write the factors of the infinite product as $1+a_n$ instead of a_n .

Thus an infinite product is usually written as $\prod_{n=1}^{\infty} (1+a_n)$ and $P_n = \prod_{k=1}^{n-1} (1+a_k)$.

(2) we shall assume throughout our discussion that $a_n > -1$ i.e. $a_n > 0 \forall n$ so that $\log(1+a_n)$ is defined for all n .

(3) for $a_n > -1$, let P_n denote the n^{th} partial product of $\prod_{n=1}^{\infty} (1+a_n)$, then

$$P_n = (1+a_1)(1+a_2) \cdots \cdots (1+a_n)$$

$$\Rightarrow \log P_n = \log(1+a_1) + \log(1+a_2) + \cdots + \log(1+a_n)$$

where $s_n = \sum_{r=1}^n \log(1+a_r)$ is the n^{th} partial sum of the series $\sum_{n=1}^{\infty} \log(1+a_n)$

$$\Rightarrow p_n = e^{s_n}$$

$$\text{If } \lim_{n \rightarrow \infty} s_n = s \text{ then } \lim_{n \rightarrow \infty} p_n = e^s.$$

Thus, to say that the product $\prod_{n=1}^{\infty} (1+a_n)$ diverges to zero,

i.e. $\lim_{n \rightarrow \infty} p_n = 0$ is equivalent to saying that the series $\sum_{n=1}^{\infty} \log(1+a_n)$ diverges to $-\infty$.

$$\text{i.e. } \lim_{n \rightarrow \infty} s_n = -\infty. \quad (\text{i.e. } \lim_{n \rightarrow \infty} p_n = e^{-\infty} = 0).$$

Problem

Show that the infinite product

$$(1 - \frac{1}{2^2})(1 - \frac{1}{3^2})(1 - \frac{1}{4^2}) \cdots$$

converges to $\frac{1}{2}$.

Sol. The given infinite product is

$$\begin{aligned} (1 - \frac{1}{2^2})(1 - \frac{1}{3^2})(1 - \frac{1}{4^2}) \cdots &= \prod_{n=1}^{\infty} \left(1 - \frac{1}{(n+1)^2}\right) \\ &= \prod_{n=1}^{\infty} \frac{(n+1)^2 - 1}{(n+1)^2} \\ &= \prod_{n=1}^{\infty} \frac{n(n+2)}{(n+1)^2} \\ &= \prod_{n=1}^{\infty} \left(\frac{n}{n+1} \cdot \frac{n+2}{n+1}\right) \end{aligned}$$

$$\therefore P_n = \left(\frac{1}{2} \cdot \frac{3}{2}\right) \left(\frac{2}{3} \cdot \frac{4}{3}\right) \left(\frac{3}{4} \cdot \frac{5}{4}\right) \cdots \left(\frac{n}{n+1} \cdot \frac{n+2}{n+1}\right)$$

$$= \left(\frac{1}{2} \cdot \frac{2}{3} \cdot \frac{3}{4} \cdots \frac{n}{n+1}\right) \left(\frac{3}{2} \cdot \frac{4}{3} \cdots \frac{n+2}{n+1}\right)$$

$$= \left(\frac{1}{n+1}\right) \left(\frac{n+2}{2}\right) = \frac{1}{2} \left(1 + \frac{1}{n+1}\right)$$

$$\Rightarrow \lim_{n \rightarrow \infty} P_n = \frac{1}{2}$$

Hence the given infinite product converges to $\frac{1}{2}$.

$$\text{i.e. } \prod_{n=1}^{\infty} \left(1 - \frac{1}{(n+1)^2}\right) = \frac{1}{2}.$$

Ques Show that the infinite product

$$\left(1 - \frac{2}{2 \cdot 3}\right) \left(1 - \frac{2}{4 \cdot 5}\right) \left(1 - \frac{2}{6 \cdot 7}\right) \dots$$

converges to $\frac{1}{3}$.

Show that the infinite products

$$(i) \prod_{n=1}^{\infty} \left(1 + \frac{1}{n}\right) \text{ and } (ii) \prod_{n=2}^{\infty} \left(1 - \frac{1}{n}\right)$$

Sol (i) Given infinite product is

$$\prod_{n=1}^{\infty} \left(1 + \frac{1}{n}\right) = \prod_{n=1}^{\infty} \left(\frac{n+1}{n}\right)$$

$$= \frac{2}{1} \cdot \frac{3}{2} \cdot \frac{4}{3} \cdot \frac{5}{4} \cdot \dots \cdot \frac{(n+1)}{n} \dots$$

$$\text{Let } P_n = \prod_{r=1}^n \left(\frac{r+1}{r}\right)$$

$$= \frac{2}{1} \cdot \frac{3}{2} \cdot \frac{4}{3} \cdot \frac{5}{4} \cdot \dots \cdot \frac{(n+1)}{n}$$

$$= n+1$$

$$\text{Now } \lim_{n \rightarrow \infty} P_n = \infty$$

\therefore The given infinite product $\prod_{n=1}^{\infty} \left(1 + \frac{1}{n}\right)$ diverges to ∞ .

$$\text{i.e. } \prod_{n=1}^{\infty} \left(1 + \frac{1}{n}\right) = \infty$$

$$(ii) \prod_{n=2}^{\infty} \left(1 - \frac{1}{n}\right) = \prod_{n=2}^{\infty} \left(\frac{n-1}{n}\right)$$

$$\therefore P_n = \frac{1}{2} \cdot \frac{2}{3} \cdot \frac{3}{4} \cdot \dots \cdot \frac{n-1}{n} = \frac{1}{n+1}$$

$$\Rightarrow \lim_{n \rightarrow \infty} P_n = 0$$

$$\therefore \prod_{n=2}^{\infty} \left(1 - \frac{1}{n}\right) \text{ diverges to } 0$$

Show that the infinite product

$$\left(1 - \frac{1}{2^2}\right) \left(1 - \frac{1}{3^2}\right) \left(1 - \frac{1}{4^2}\right) \dots$$

(check if it is convergent or not)

$$\text{Let } P = \left(1 - \frac{1}{2^2}\right) \left(1 - \frac{1}{3^2}\right) \left(1 - \frac{1}{4^2}\right) \dots$$

Then $\log P = \log \left(1 - \frac{1}{2^2}\right) + \log \left(1 - \frac{1}{3^2}\right) + \dots$

$$= \sum_{n=2}^{\infty} \log \left(1 - \frac{1}{n^2}\right)$$

$$= \sum_{n=2}^{\infty} a_n \text{ (say)} \quad \text{--- (1)}$$

$$\text{Now } a_n = \log \left(1 - \frac{1}{n^2}\right)$$

$$= -\left[\frac{1}{n^2} + \frac{1}{2n^4} + \frac{1}{3n^6} + \dots \right]$$

$$\therefore \log \left(1 - \frac{1}{n^2}\right) = -\left(a + \frac{a^2}{2} + \frac{a^3}{3} + \dots\right)$$

$$= -\frac{1}{n^2} \left[1 + \frac{1}{2n^2} + \frac{1}{3n^4} + \dots \right].$$

$$\text{Let } b_n = \frac{1}{n^2} + \dots$$

Then $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \left[1 + \frac{1}{2n^2} + \dots \right]$

$$= 1 \neq 0$$

Here $\sum b_n = \sum \frac{1}{n^2}$ is cgt (by p-test)

\therefore by comparison test,

$$\sum a_n \text{ is cgt.}$$

and it is convergent to a finite number

$$S \text{ (say)}$$

from (1), $\log P = a$ finite number's when $n \rightarrow \infty$

if $P = a$ finite number's when $n \rightarrow \infty$

The given product is cgt.

∴ the infinite product
 $\left(1 - \frac{1}{2^2}\right) \left(1 - \frac{1}{3^2}\right) \left(1 - \frac{1}{4^2}\right) \dots$ is convergent

Ques Show that the infinite product

$$\frac{1}{2} \cdot \frac{3}{2} \cdot \frac{3}{4} \cdot \frac{5}{4} \cdot \frac{5}{6} \cdot \frac{7}{6} \cdots \frac{(2n-1)}{2n} \cdot \frac{2n+1}{2n}$$

tends to a finite limit as $n \rightarrow \infty$.

Sol S.t. the infinite product

$$(1 + \frac{1}{2})(1 - \frac{1}{3})(1 + \frac{1}{4})(1 - \frac{1}{5}) \cdots$$

converges to 1.

Sol Given infinite product is

$$(1 + \frac{1}{2})(1 - \frac{1}{3})(1 + \frac{1}{4})(1 - \frac{1}{5}) \cdots$$

$$\text{Let } P = (1 + \frac{1}{2})(1 - \frac{1}{3})(1 + \frac{1}{4})(1 - \frac{1}{5}) \cdots = (\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots)$$

$$\therefore \log P = \log \left((1 + \frac{1}{2})(1 + \frac{1}{4}) \right) + \log \left((1 + \frac{1}{4})(1 - \frac{1}{5}) \right)$$

$$+ \cdots + \log \left[(1 + \frac{1}{m})(1 - \frac{1}{m+1}) \right] + \cdots$$

$$= \sum_{n=1}^{\infty} \log \left[(1 + \frac{1}{2n}) \left(1 - \frac{1}{2n+1} \right) \right]$$

$$= \sum_{n=1}^{\infty} \log \left[1 + \frac{1}{2n} - \left(1 + \frac{1}{2n} \right) \left(\frac{1}{2n+1} \right) \right]$$

$$= \sum_{n=1}^{\infty} \log \left[1 + \left(\frac{1}{2n} - \frac{1}{2n+1} \right) - \frac{1}{2n(2n+1)} \right]$$

$$= \sum_{n=1}^{\infty} \log \left[1 + \frac{1}{2n(2n+1)} - \frac{1}{2n(2n+1)} \right]$$

$$= \sum_{n=1}^{\infty} \log [1] = 0.$$

$$\therefore \log P = 0 \Rightarrow P = e^0 = 1.$$

\therefore The given infinite product is convergent and it converges to 1.

A necessary condition for convergence:

If the product $\prod_{n=1}^{\infty} (1 + a_n)$ is convergent, then

$$\lim_{n \rightarrow \infty} a_n = 0$$

proof Given that $\prod_{n=1}^{\infty} (1+a_n)$ is cgt.
and it cgts to P (say) (25)

$\therefore P \neq 0; \lim_{n \rightarrow \infty} p_n = P$ and $\lim_{n \rightarrow \infty} p_{n-1} = P$.

$$\text{Now } \frac{p_n}{p_{n-1}} = \frac{(1+a_1)(1+a_2)\dots(1+a_n)}{(1+a_1)(1+a_2)\dots(1+a_{n-1})}$$

$$\frac{p_n}{p_{n-1}} = (1+a_n)$$

$$\therefore \lim_{n \rightarrow \infty} (1+a_n) = \lim_{n \rightarrow \infty} \frac{p_n}{p_{n-1}} = \lim_{n \rightarrow \infty} \frac{p_n}{p_{n-1}} = 1.$$

$$\lim_{n \rightarrow \infty} (1+a_n) = 1 \Rightarrow \lim_{n \rightarrow \infty} 1+a_n = 1 \Rightarrow \boxed{\lim_{n \rightarrow \infty} 1+a_n = 0}.$$

Note:- The converse of the above need not be true. i.e. if $\lim_{n \rightarrow \infty} 1+a_n = 0$ then $\prod_{n=1}^{\infty} (1+a_n)$ need not be cgt.

for example

The infinite product is

$$\prod_{n=1}^{\infty} \left(1 + \frac{1}{n}\right) = \prod_{n=1}^{\infty} (1+a_n)$$

Here $a_n = \frac{1}{n} \rightarrow 0$ as $n \rightarrow \infty$

but the product is divergent. (already done)

General principle of convergence of an infinite product:

A necessary and sufficient condition for the convergence of the infinite product

for the convergence of the infinite product $\prod_{n=1}^{\infty} (1+a_n)$ is that for every $\epsilon > 0$, there exists

a positive integer 'm' s.t. $\left| \frac{p_{n+1}}{p_n} - 1 \right| < \epsilon \forall n \geq m$.

Note! In order to establish the convergence (or divergence) of infinite product, we now give the following statements:

- If $a_n > 0$ then the series $\sum_{n=1}^{\infty} a_n$ and the product $\prod_{n=1}^{\infty} (1+a_n)$ converge or diverge together.
- If $-1 < a_n \leq 0$, then the series $\sum_{n=1}^{\infty} a_n$ and the product $\prod_{n=1}^{\infty} (1+a_n)$ converge or diverge together.
- If $0 \leq b_n < 1$ then $\prod_{n=1}^{\infty} (1+b_n)$ converges to non-zero finite limit, if $\sum_{n=1}^{\infty} b_n$ converges and diverges to zero if $\sum_{n=1}^{\infty} b_n$ diverges.
- If the series $\sum_{n=1}^{\infty} a_n^2$ is convergent, then the product $\prod_{n=1}^{\infty} (1+a_n)$ and series $\sum_{n=1}^{\infty} a_n$ converge or diverge together.
- If $\sum_{n=1}^{\infty} a_n^2$ is convergent, then we have $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} \log(1+a_n)$ converge or diverge together.
- Also $\sum_{n=1}^{\infty} \log(1+a_n)$ and $\sum_{n=1}^{\infty} (1+a_n)$ converge or diverge together.

- We have
- If $\sum_{n=1}^{\infty} a_n$ converges, then $\sum_{n=1}^{\infty} \log(1+a_n)$ converges and therefore $\prod_{n=1}^{\infty} (1+a_n)$ converges.
- If $\sum_{n=1}^{\infty} a_n$ diverges to ∞ , then $\sum_{n=1}^{\infty} \log(1+a_n)$ diverges to ∞ and therefore $\prod_{n=1}^{\infty} (1+a_n)$ diverges to ∞ .
- If $\sum_{n=1}^{\infty} a_n$ diverges to $-\infty$, then $\sum_{n=1}^{\infty} \log(1+a_n)$ diverges to $-\infty$ and therefore $\prod_{n=1}^{\infty} (1+a_n)$ diverges to zero.

Also, if $\sum_{n=1}^{\infty} a_n$ diverges and $\sum_{n=1}^{\infty} b_n$ converges or oscillates finitely, then $\prod_{n=1}^{\infty} (1+a_n)$ diverges to zero.

(26)

→ Absolute convergence of infinite products

Def: The product $\prod_{n=1}^{\infty} (1+a_n)$ is said to be absolutely convergent if the product $\prod_{n=1}^{\infty} (1+|a_n|)$ is convergent.

→ The product $\prod_{n=1}^{\infty} (1+a_n)$ is absolutely convergent iff the series $\sum_{n=1}^{\infty} |a_n|$ is absolutely convergent.

→ The product $\prod_{n=1}^{\infty} (1+a_n)$ is absolutely convergent iff the series $\sum_{n=1}^{\infty} \log(1+a_n)$ is absolutely convergent.

→ Every absolutely convergent infinite product is convergent.
i.e. If $\prod_{n=1}^{\infty} (1+a_n)$ is an absolutely convergent
(i.e. $\prod_{n=1}^{\infty} (1+|a_n|)$ is cgt).

Then $\prod_{n=1}^{\infty} (1+a_n)$ is cgt.

Note!:- The factors of an absolutely convergent infinite product may be rearranged in any order without affecting its convergence.

problems

→ Discuss the convergence of the infinite products:

$$(i) \prod_{n=1}^{\infty} \left(1 + \frac{1}{n^2}\right) \quad (ii) \prod_{n=1}^{\infty} \left(1 + \frac{1}{n^{3/2}}\right) \quad (iii) \prod_{n=1}^{\infty} \left(1 + \frac{1}{n^2}\right)^{1/x}, x > 1$$

$$(iv) \prod_{n=1}^{\infty} \left(1 + \frac{1}{n^x}\right), 0 < x \leq 1 \quad (v) \prod_{n=1}^{\infty} \left(1 + \frac{1}{\sqrt{n}}\right) \quad (vi) \prod_{n=1}^{\infty} \left(\frac{n+1}{n}\right)$$

Sol. (i) The given product is

$$\prod_{n=1}^{\infty} \left(1 + \frac{1}{n^2}\right) = \prod_{n=1}^{\infty} (1+a_n), \text{ where } a_n = \frac{1}{n^2} > 0$$

Since $\sum_{n=1}^{\infty} \frac{1}{n^n}$ is cgt (by p-test)
here $p > 1$

$$\therefore \text{the product } \prod_{n=1}^{\infty} (1 + a_n) = \prod_{n=1}^{\infty} \left(1 + \frac{1}{n^n}\right)$$

is cgt

→ Discuss the convergence of the infinite products.

$$(i) \prod_{n=1}^{\infty} \left(1 - \frac{1}{n^n}\right) \quad (ii) \prod_{n=1}^{\infty} \left(1 - \frac{1}{n^n}\right) \quad (iii) \prod_{n=1}^{\infty} \left(1 - \frac{1}{\sqrt[n]{n}}\right)$$

$$(iv) \frac{3}{4} \cdot \frac{6}{7} \cdot \frac{9}{10} \cdots \frac{3n}{3n+1} = \prod_{n=1}^{\infty} \left(\frac{3n}{3n+1}\right) \\ = \prod_{n=1}^{\infty} \left(1 - \frac{1}{3n+1}\right)$$

Sol (i) The given product is

$$\prod_{n=1}^{\infty} \left(1 - \frac{1}{n^n}\right) = \prod_{n=1}^{\infty} (1 - b_n), \text{ where } b_n = \frac{1}{n^n} \text{ and } n > 1$$

so that $0 < b_n < 1$

∴ The product $\prod_{n=1}^{\infty} (1 - b_n)$ and the series $\sum_{n=1}^{\infty} b_n$ converge or diverge together.

But the series $\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{1}{n^n}$ is cgt
(by p-test)

∴ the given product is cgt

(ii) The product is $\prod_{n=1}^{\infty} \left(1 - \frac{1}{3n+1}\right) = \prod_{n=1}^{\infty} (1 - b_n)$

where $b_n = \frac{1}{3n+1}$ and $n > 1$

so that $0 < b_n < 1$.

∴ The product $\prod_{n=1}^{\infty} (1 - b_n)$ and the series $\sum_{n=1}^{\infty} b_n$ converge or diverge together.

But the series $\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{1}{3n+1}$ dgs

∴ The product $\prod_{n=1}^{\infty} (1 - b_n)$ dgs to zero.

→ Discuss the convergence of the infinite products:

$$(i) \prod_{n=1}^{\infty} \left(1 + \sin^2 \frac{\alpha}{n}\right) \quad (ii) \prod_{n=1}^{\infty} \left(1 + n \sin \frac{\alpha}{n^2}\right)$$

$$(iii) \prod_{n=1}^{\infty} \left(1 + \frac{a}{n^p}\right), \text{ where } a \text{ is a real number}$$

Sol The given product is $\prod_{n=1}^{\infty} \left(1 + \sin^2 \frac{\alpha}{n}\right) = \prod_{n=1}^{\infty} (1 + a_n)$

$$\text{where } a_n = \sin^2 \frac{\alpha}{n} \geq 0 \text{ for all } n.$$

The product $\prod_{n=1}^{\infty} (1 + a_n)$ and the

series $\sum a_n$ converge or diverge

together.

$$\begin{aligned} \text{Now, } a_n &= \sin^2 \frac{\alpha}{n} = \left(\sin \frac{\alpha}{n}\right)^2 \\ &= \left(\frac{\alpha}{n} - \frac{1}{2!} \cdot \frac{\alpha^3}{n^3} + \frac{1}{5!} \cdot \frac{\alpha^5}{n^5} - \dots\right)^2 \\ &= \frac{\alpha^2}{n^2} - 2 \left(\frac{1}{2!} \cdot \frac{\alpha^4}{n^4}\right) + \dots \\ &= \frac{1}{n^2} \left[\alpha^2 - 2 \left(\frac{1}{2!} \cdot \frac{\alpha^4}{n^4}\right) + \dots\right] \end{aligned}$$

$$\text{Take } b_n = \frac{1}{n^2}$$

$$\therefore \lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \alpha^2$$

Since $\sum b_n = \sum \frac{1}{n^2}$ is g.t.

∴ by comparison test $\sum a_n$ is g.t.

Hence the given product is g.t.

$$(iii) \prod_{n=1}^{\infty} \left(1 + \frac{a}{n^p}\right) = \prod_{n=1}^{\infty} (1 + a_n)$$

$$\text{where } a_n = \frac{a}{n^p} \geq 0 \text{ for all } n.$$

∴ The product $\prod_{n=1}^{\infty} (1 + a_n)$ and the series $\sum a_n$ converge or diverge together.

$$\text{Now } \sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \frac{a}{n^p} = a \sum_{n=1}^{\infty} \frac{1}{n^p}$$

which is cgt if $p > 1$

and dgt if $p \leq 1$.

Hence the given product is also converges
if $p > 1$ and dgt if $p \leq 1$.

$$\rightarrow S.T (1+a) \left(1+\frac{a}{2}\right) \left(1+\frac{a}{3}\right) \dots$$

dgs to $+\infty$ or to '0' according as
 $a > 0$ or $a < 0$

Sol The given product is

$$\prod_{n=1}^{\infty} \left(1 + \frac{a}{n}\right) = \prod_{n=1}^{\infty} (1+a_n)$$

where $a_n = \frac{a}{n}$

$$\text{Now } \sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \frac{a}{n} = a \sum_{n=1}^{\infty} \frac{1}{n}$$

which dgs to $+\infty$ if $a > 0$

dgs to $-\infty$ if $a < 0$

Hence the given product dgs to ∞ if $a > 0$
dgs to $-\infty$ if $a < 0$

Discuss the convergence of the product:

$$(i) \prod_{n=2}^{\infty} \left(1 + \frac{(-1)^n}{n}\right)$$

$$(ii) \left(1 - \frac{1}{2}\right) \left(1 + \frac{1}{3}\right) \left(1 - \frac{1}{4}\right) \left(1 + \frac{1}{5}\right) \dots$$

$$(iii) \left(1 + \frac{1}{2}\right) \left(1 - \frac{1}{3}\right) \left(1 + \frac{1}{4}\right) \left(1 - \frac{1}{5}\right) \dots$$

$$(iv) \left(1 + \frac{1}{2}\right) \left(1 - \frac{1}{3}\right) \left(1 + \frac{1}{4}\right) \left(1 - \frac{1}{5}\right) \dots$$

$$(v) \prod_{n=1}^{\infty} \left(1 + \frac{(-1)^{n+1}}{\sqrt{n}}\right).$$

Sol (1) The given product is

$$\prod_{n=2}^{\infty} \left(1 + \frac{(-1)^n}{n}\right) = \prod_{n=2}^{\infty} (1+a_n) \text{ where } a_n = \frac{(-1)^n}{n}$$

now $\sum_{n=2}^{\infty} a_n = \sum_{n=2}^{\infty} \frac{(-1)^n}{n}$ is ~~cgt~~ by Leibnitz's test

$$\text{and } \sum_{n=2}^{\infty} a_n^2 = \sum_{n=2}^{\infty} \frac{1}{n^2} \text{ is } \overset{\text{given}}{\cancel{\text{cgt}}}$$

\therefore the product is ~~cgt~~

→ Discusses the convergence of the infinite product $(1-t)(1+\frac{t}{2})(1-\frac{t}{2})(1+\frac{t}{2})\dots$

Sol The given product is $\prod_{n=1}^{\infty} \left(1 + (-1)^n \cdot \frac{1}{2}\right)$

$$= \prod_{n=1}^{\infty} (1+a_n) \text{ where } a_n = (-1)^n \cdot \frac{1}{2}$$

$$\text{Now } \sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} (-1)^n \cdot \frac{1}{2}$$

$$= \frac{1}{2} \sum_{n=1}^{\infty} (-1)^n$$

$$= \frac{1}{2} (-1 + 1 - 1 + 1 - \dots)$$

which oscillates b/w $-\frac{1}{2}$ and 0 .

$$\sum_{n=1}^{\infty} a_n^2 = \sum_{n=1}^{\infty} \frac{1}{4} = \frac{1}{4} + \frac{1}{4} + \dots$$

which is ~~cgt~~ ($\rightarrow \infty$)

Hence the given product ~~div~~ to zero.

HW Discuss the convergence of $\prod_{n=1}^{\infty} (1 + (-1)^n)$.

→ Show that the infinite product

$\prod_{n=2}^{\infty} \left(1 + \frac{(-1)^n}{n^2}\right)$ is convergent if $\alpha > \frac{1}{2}$.

Sol The given product is

$$\prod_{n=2}^{\infty} \left(1 + \frac{(-1)^n}{n^2}\right) = \prod_{n=2}^{\infty} (1+a_n)$$

where $a_n = \frac{(-1)^n}{n^2}$

$$\text{Now } \sum_{n=2}^{\infty} a_n = \sum_{n=2}^{\infty} \frac{(-1)^n}{n^2} \text{ cgs if } \alpha > 0 \quad (\text{by Leibniz's test})$$

$$\text{Also } \sum_{n=2}^{\infty} a_n = \sum_{n=2}^{\infty} \frac{1}{n^2} \text{ cgs if } \alpha > 1$$

given
Hence the product cgs if $\alpha > \frac{1}{2}$.

Sol Discuss the convergence of the product

$$\prod_{n=1}^{\infty} \left[1 + \left(\frac{n\alpha}{n+1}\right)^n\right]$$

$$\text{Here } a_n = \left(\frac{n\alpha}{n+1}\right)^n$$

$$\therefore a_n^{1/n} = \frac{n\alpha}{n+1} = \frac{\alpha}{1 + \frac{1}{n}}$$

$$\therefore \lim_{n \rightarrow \infty} a_n^{1/n} = \alpha.$$

By Cauchy's root test, the series $\sum_{n=1}^{\infty} a_n$ is
cgt if $\alpha > 1$ and
dgt if $\alpha < 1$.

Hence the given product is cgt if $\alpha < 1$
and dgt if $\alpha > 1$.

$$\text{If } \alpha = 1 \text{ then } a_n = \left(\frac{n}{n+1}\right)^n = \left(\frac{1}{1 + \frac{1}{n}}\right)^n$$

$$\therefore \lim_{n \rightarrow \infty} a_n = \frac{1}{e} \neq 0 \text{ and } a_n > 0 \text{ for all } n.$$

$\therefore \sum a_n$ is dgt.

Hence $\prod_{n=1}^{\infty} (1+a_n)$ is dgt.

Thus the given product is cgt if $\alpha < 1$ and dgt if $\alpha > 1$.

→ Discusses absolute convergence of the following infinite products:

$$(i) \prod_{n=1}^{\infty} \cos \frac{\alpha}{n} \quad (ii) \prod_{n=1}^{\infty} \left[\frac{\sin \frac{\alpha}{n}}{\frac{\alpha}{n}} \right].$$

Sol (i) Here $1+a_n = \cos \frac{\alpha}{n}$.

$$1 - \frac{1}{2!} \cdot \frac{\alpha^2}{n^2} + \frac{1}{4!} \cdot \frac{\alpha^4}{n^4} - \dots$$

$$\Rightarrow a_n = \frac{1}{2!} \cdot \frac{\alpha^2}{n^2} - \frac{1}{4!} \cdot \frac{\alpha^4}{n^4} - \dots$$

$$= \frac{1}{n^2} \left(-\frac{\alpha^2}{2!} + \frac{\alpha^4}{4!} - \dots \right)$$

$$\text{Now } |a_n| = \frac{1}{n^2} \left| -\frac{\alpha^2}{2!} + \frac{\alpha^4}{4!} - \dots \right|.$$

$$\text{Let } b_n = \frac{1}{n^2}, \text{ then } \lim_{n \rightarrow \infty} \frac{|a_n|}{b_n} = \frac{\alpha^2}{2},$$

(a finite quantity)

But $\sum b_n = \sum \frac{1}{n^2}$ is gt (by p-test).

$\therefore \sum |a_n|$ is gt (by comparison test).

$\therefore \sum a_n$ is absolutely convergent.

The product $\prod_{n=1}^{\infty} \cos \frac{\alpha}{n}$ is

absolutely gt.

$$(ii) \text{ Here } 1+a_n = \frac{\sin \frac{\alpha}{n}}{\frac{\alpha}{n}}$$

$$= \frac{1}{(\frac{\alpha}{n})} \left[\frac{\alpha}{n} - \frac{1}{2!} \cdot \frac{\alpha^2}{n^2} + \frac{1}{4!} \cdot \frac{\alpha^4}{n^4} - \dots \right]$$

$$= 1 - \frac{1}{3!} \cdot \frac{\alpha^2}{n^2} + \frac{1}{5!} \cdot \frac{\alpha^4}{n^4} - \dots$$

$$\Rightarrow a_n = -\frac{1}{3!} \cdot \frac{\alpha^2}{n^2} + \frac{1}{5!} \cdot \frac{\alpha^4}{n^4} - \dots$$

$$\therefore = \frac{1}{n!} \left(-\frac{x^2}{3!} + \frac{x^3}{5!} - \dots \right) \text{ proceed in this way.}$$

\rightarrow prove that $\prod_{n=1}^{\infty} \left(1 + \frac{x^n}{n}\right) e^{-x/n}$ is absolutely convergent for any real x .

$$\underline{\text{Sol}} \quad \text{Here } 1+a_n = \left(1 + \frac{x^n}{n}\right) e^{-x/n}$$

$$= \left(1 + \frac{x^n}{n}\right) \left(1 - \frac{x}{n} + \frac{x^2}{2n^2} - \frac{x^3}{3n^3} \dots\right)$$

$$= 1 - \frac{x^n}{n^2} + \frac{x^n}{2n^2} + \frac{x^3}{2n^2} - \frac{x^3}{6n^3} \dots$$

$$\Rightarrow a_n = \frac{-x^n}{2n^2} + \frac{x^3}{3n^3} \dots$$

$$= \frac{1}{n!} \left(-\frac{x^n}{2} + \frac{x^3}{2} - \dots \right) \dots$$

• proceed

in this way.

P.T $\prod_{n=1}^{\infty} \left(1 + \frac{x}{n^n}\right) e^{-\frac{x}{n^n}}$ is absolutely cgt
for all values of x .

H.W P.T $\prod_{n=1}^{\infty} \left(1 + \frac{1}{n}\right) e^{-\frac{1}{n}}$ is absolutely cgt.

\rightarrow Test the absolutely convergence of the infinite product $\prod_{n=1}^{\infty} \frac{(x+x^{2n})}{1+x^{2n}}$.

$$\underline{\text{Sol}} \quad \text{Here } 1+a_n = \frac{x+x^{2n}}{1+x^{2n}} = \frac{(1+x^{2n})+(x-1)}{1+x^{2n}}$$

$$\Rightarrow 1+a_n = 1 + \frac{x-1}{1+x^{2n}}$$

$$\Rightarrow \boxed{a_n = \frac{x-1}{1+x^{2n}}}$$

Now, when $|x| > 1$, we have

$$|a_n| = \left| \frac{n-1}{1+x^{2n}} \right| = \frac{|x-1|}{|1+x^{2n}|} = \frac{|x-1|}{1+x^{2n}} < \frac{|x-1|}{x^{2n}} \quad (1)$$

Now $\sum_{n=1}^{\infty} \frac{1}{x^{2n}} = \sum u_n$ (say).

Here $u_n = \frac{1}{x^{2n}}$

$u_n^k = \frac{1}{x^{2k}}$

$\therefore \lim_{n \rightarrow \infty} u_n = \frac{1}{x^2} < 1 \quad (\because |x| > 1)$

\therefore by Cauchy's root test $\sum \frac{1}{x^{2n}}$ is ge.

\therefore by comparison test,

$\sum |a_n|$ is ge

$\therefore \sum a_n$ is absolutely ge.

Hence $\prod_{n=1}^{\infty} (1+a_n)$ is absolutely convergent.

Now, when $|x| < 1$ (i.e. $-1 < x < 1$),

we have

$$1+a_n = \frac{x+x^{2n}}{1+x^{2n}} = \frac{x(1+x^{2n-1})}{1+x^{2n}} \rightarrow x \quad (\because x \neq 0)$$

$\therefore 1+a_n \rightarrow x$ as $n \rightarrow \infty$.

$\Rightarrow a_n \rightarrow x-1$. as $n \rightarrow \infty$.

$\Rightarrow a_n$ does not tend to ∞ ($\because -1 < x < 1$)

i.e. $x+a_n \neq 0$.

\therefore the product $\prod_{n=1}^{\infty} (1+a_n)$ is divergent.

Now, when $x = 1$,

every factor is unity

$$\text{i.e. } \prod_{n=1}^{\infty} \left(\frac{x+x^{2n}}{1+x^{2n}} \right) = \left(\frac{1+1}{1+1} \right) \left(\frac{1+1^4}{1+1^4} \right) \dots \dots \dots$$

$$= \frac{2}{2} \cdot \frac{2}{2} \cdot \dots \dots \dots$$

$$= 1 \cdot 1 \cdot \dots \dots \dots$$

Hence the product is convergent.

Now, when $x = 1$,

every factor is zero.

Hence the product is divergent.

Discuss the convergence of the infinite product

$$\prod_{n=1}^{\infty} \left(1 + \frac{x^n}{x^{2n} + 1}\right).$$

Sol Here $1 + a_n = 1 + \frac{x^n}{x^{2n} + 1}$ so that $a_n = \frac{x^n}{x^{2n} + 1}$

Now $a_{n+1} = \frac{x^{n+1}}{x^{2n+2} + 1}$

$$\begin{aligned} \left| \frac{a_n}{a_{n+1}} \right| &= \left| \frac{x^n}{x^{2n} + 1} \cdot \frac{x^{n+2} + 1}{x^{n+1}} \right| \\ &= \left| \frac{x^{n+2} + 1}{x(x^{2n} + 1)} \right| = \frac{|x^{n+2} + 1|}{|x||x^{2n} + 1|} \end{aligned}$$

If $|x| < 1$ (i.e. $-1 < x < 1$),

$$\lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right| = \frac{1}{|x|} > 1$$

By ratio test, $\sum |a_n|$ cgs and hence
 $\prod (1+a_n)$ cgs absolutely.

If $|x| > 1$,

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right| &= \lim_{n \rightarrow \infty} \left| \frac{x^{2n+2} + 1}{x^{n+1} + x} \right| \\ &= \lim_{n \rightarrow \infty} \left| \frac{x + \frac{1}{x^{2n+1}}} {1 + \frac{1}{x^{2n}}} \right| = |x| > 1 \end{aligned}$$

By ratio test, $\sum |a_n|$ cgs and hence
 $\prod (1+a_n)$ cgs absolutely.

$$\text{If } x=1, \quad a_n = \frac{1}{2} + n.$$

$$\lim_{n \rightarrow \infty} a_n \neq 0.$$

The product $\prod_{n=1}^{\infty} (1+a_n)$ is dgt.
(or)

$$\text{If } x \neq 1, \quad a_n = \frac{1}{2} + n.$$

$$\therefore \sum a_n = \sum_{n=1}^{\infty} \left(\frac{1}{2} + n \right) = \infty$$

$$\text{Let } S_n = \left(\frac{1}{2} + \frac{1}{2} + \dots + \frac{1}{2} \right) (\text{n times})$$

$$= \frac{n}{2}$$

$$\lim_{n \rightarrow \infty} S_n = \infty$$

$\therefore \sum a_n$ is dgt.

Hence the product $\prod_{n=1}^{\infty} (1+a_n)$ is dgt

If $x = -1$, the product $\prod_{n=1}^{\infty} \left(1 + \frac{x^n}{n+1} \right)$ becomes

$$\left(1 - \frac{1}{2} \right) \left(1 - \frac{1}{2} \right) \left(1 - \frac{1}{2} \right) \cdots \left(1 - \frac{1}{2} \right) \cdots$$

which dgs to '0' (already we have done.)

Show that $\prod_{n=2}^{\infty} \left[1 - \left(1 - \frac{1}{n} \right)^{-n} x^n \right]$ dgs absolutely
for $|x| > 1$.

$$\text{Sol} \quad \text{Here if } a_n = 1 - \left(1 - \frac{1}{n} \right)^{-n} x^n \text{ so that}$$

$$a_n = - \left(1 - \frac{1}{n} \right)^{-n} x^n$$

$$\text{Now } a_{n+1} = - \left(1 - \frac{1}{n+1} \right)^{-n-1} x^{n+1}$$

$$\therefore \frac{a_n}{a_{n+1}} = \frac{- \left(1 - \frac{1}{n} \right)^{-n} x^n}{- \left(1 - \frac{1}{n+1} \right)^{-n-1} x^{n+1}} = \frac{\left(1 - \frac{1}{n} \right)^{n+1}}{\left(1 - \frac{1}{n+1} \right)^n} \cdot x$$

$$\therefore \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right| = \frac{e}{e} |a_1|$$

$$= |a_1| > 1$$

∴ by ratio test, $\sum |a_n|$ is gt.

Hence the infinite product is absolutely.

→ Show that $\prod_{n=0}^{\infty} (1+x^{2^n})$ is $\frac{1}{1-x}$ if $|x| < 1$.

Sol Given infinite product is

$$\prod_{n=0}^{\infty} (1+x^{2^n}) = (1+x) (1+x^2) (1+x^4) \cdots (1+x^{2^{n-1}}) (1+x^{2^n}) \cdots \cdots$$

Let

$$\begin{aligned} P_n &= \prod_{n=0}^{n-1} (1+x^{2^n}) = (1+x) (1+x^2) (1+x^4) \cdots (1+x^{2^{n-1}}) \\ &= \left(\frac{1}{1-x} \right) \left[(1+x) : (1+x^2) (1+x^4) (1+x^8) (1+x^{16}) \cdots (1+x^{2^{n-1}}) \right] \\ &= \frac{1}{1-x} \left[(1-x^2) (1+x^2) (1+x^4) \cdots (1+x^{2^{n-1}}) \right] \\ &= \frac{1}{1-x} \left[(1-(x^2)^2) (1+x^2)^2 (1+x^4)^2 \cdots (1+x^{2^{n-1}})^2 \right] \\ &= \frac{1}{1-x} \left[(1-x^4) (1+x^4) (1+x^8) \cdots (1+x^{2^{n-1}}) \right] \\ &= \frac{1}{1-x} \left[(1-x^8) (1+x^8) (1+x^{16}) \cdots (1+x^{2^{n-1}}) \right] \\ &= \frac{1}{1-x} \left[(1-(x^8)^2) (1+x^8)^2 (1+x^{16}) \cdots (1+x^{2^{n-1}}) \right] \\ &= \frac{1}{1-x} \left[(1-x^{16}) (1+x^{16}) \cdots (1+x^{2^{n-1}}) \right] \\ &= \frac{1}{1-x} \left[(1-x^{2^4}) (1+x^{2^4}) \cdots (1+x^{2^{n-1}}) \right] \\ &= \frac{1}{1-x} (1-x^{2^n}). \end{aligned}$$

Now if $|z| < 1$ (i.e. $-1 < z < 1$)

Then $z^n \rightarrow 0$ as $n \rightarrow \infty$.

$P_n \rightarrow \frac{1}{1-z}$ as $n \rightarrow \infty$

the infinite product $\prod_{n=0}^{\infty} (1+z^{2^n})$ goes to

$$\frac{1}{1-z}$$

~~Now~~ $\sum_{n=0}^{\infty} \left[1 + \left(\frac{1}{2} \right)^{2^n} \right]$ goes to 2
(Hint: put $z = \frac{1}{2}$).

Set - IV

Limits and Continuity

Real valued functions:

Constant function: A function $f: \mathbb{R} \rightarrow \mathbb{R}$

defined by $f(x) = k$, ($k \in \mathbb{R}$) is called a constant function.

Range of $f = \{k\}$ a singleton set.

Identity function: A function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined

by $f(x) = x$ is called the Identity function.

Range of $f = \mathbb{R} = \text{Domain of } f$

Polynomial function: A function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined

by $f(x) = a_0 + a_1x + a_2x^2 + \dots + a_nx^n$, where $a_0, a_1, a_2, \dots, a_n \in \mathbb{R}$.

$n \in \mathbb{N}$ and $a_n \neq 0$ is called a polynomial function of n^{th} degree.

If $a_0 = a_1 = \dots = a_n = 0$ then $f(x) = 0 \forall x \in \mathbb{R}$.

In this case we say that f is a zero polynomial function.

Rational function: If f, g are two polynomials

functions and $A = \{x/x \in \mathbb{R}, g(x) \neq 0\}$ then the

function $h: A \rightarrow \mathbb{R}$ defined by $h(x) = \frac{f(x)}{g(x)}$

is called a rational function.

Ex: $h(x) = \frac{1}{x}$ is a rational function with domain $\mathbb{R} - \{0\}$.

Power function: A function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined

by $f(x) = x^n$ where $n \in \mathbb{N}$ is called power function.

if the square root function defined

→ Absolute value function (or) Mod function:

The function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined by

$$f(x) = x \text{ if } x \geq 0$$

$$= -x \text{ if } x < 0$$

is called mod function.

It is denoted by $f(x) = |x|$.

Range of $f = [0, \infty)$.

→ Signature function:

The function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined by

$$f(x) = 1 ; x > 0$$

$$= 0 ; x = 0$$

$$= -1 ; x < 0$$

is called signature function.

It is denoted by $f(x) = \operatorname{sgn}(x)$.

$$\text{i.e., } \operatorname{sgn}(x) = 1 \text{ if } x > 0$$

$$= 0 \text{ if } x = 0$$

$$= -1 \text{ if } x < 0$$

$$\text{i.e., } \operatorname{sgn}(x) = \begin{cases} \frac{|x|}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

Range of $\operatorname{sgn}(x) = \{-1, 0, 1\}$

→ Integral part function or Step function
or greatest integer function

The function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined by

$f(x) = [x] = \text{integral part of } x$, i.e. called

step function.

i.e., $f(x) = [x]$ is a greatest integer $\leq x$,

is called the greatest integer function.

i.e., for every $x \in \mathbb{R}$, \exists unique $n \in \mathbb{Z}$ such that

$$n \leq x < n+1 \quad \text{and} \quad [x] = n.$$

The range of the step function $= \mathbb{Z}$.

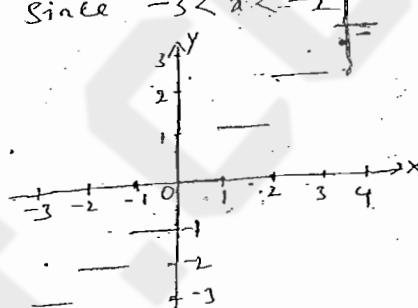

Ex: $x = 2.5 ; [x] = 2$ since $2 < x < 3$.
 $x \in [2, 2+1]$

$$x = 0.1 ; [x] = 0 \quad \text{since } 0 < x < 1$$

$$x = 0 ; [x] = 0 \quad \text{since } 0 \leq x < 1$$

$$x = -2.5 ; [x] = -3 \quad \text{since } -3 < x < -2$$

$$x = 1.5 ; [x] = 1$$

→ Exponential function:

The function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = e^x$ is called exponential function.

The range of exponential function $= \mathbb{R}^+$.

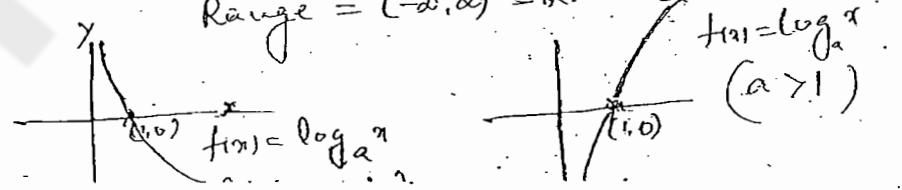

→ If $a \in \mathbb{R} - \{1\}$ then $f(x) = a^x$ from $\mathbb{R} \rightarrow \mathbb{R}^+$ is also called exponential function.

→ Logarithmic function:

The exponential function $f: \mathbb{R} \rightarrow \mathbb{R}^+$ defined by $f(x) = e^x$ is both $1-1$ and onto. The inverse function of this exponential function is called Logarithmic function.

$f: \mathbb{R}^+ \rightarrow \mathbb{R}$ defined by $f(x) = \log x$ is the natural logarithmic function.

$$\text{Range} = (-\infty, \infty) \subset \mathbb{R}$$

→ Trigonometric functions:

- The function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = \sin x$
is called sine function.

$$\text{Range } f = [-1, 1]$$

- The function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = \cos x$
is called cosine function.

$$\text{Range } f = [-1, 1]$$

- If $A = \{x \in \mathbb{R} / x = n\pi + \frac{\pi}{2}; n \in \mathbb{Z}\}$ then the
(or) $\{x \in \mathbb{R} / x = (2n+1)\frac{\pi}{2}; n \in \mathbb{Z}\}$ function $f: (\mathbb{R} - A) \rightarrow \mathbb{R}$ defined by

$$f(x) = \frac{\sin x}{\cos x} = \tan x$$

is called tangent function.

Domain $f = \mathbb{R} - A$ (odd values)

$$\text{Range } f = \mathbb{R}$$

- If $A = \{x \in \mathbb{R} / x = n\pi; n \in \mathbb{Z}\}$ then the function

$$f: \mathbb{R} - A \rightarrow \mathbb{R} \text{ defined by } f(x) = \frac{\cos x}{\sin x} = \cot x$$

is called cotangent function.

Domain $f = \mathbb{R} - A$

$$\text{Range } f = \mathbb{R}$$

- If $A = \{x \in \mathbb{R} / x = (2n+1)\frac{\pi}{2}; n \in \mathbb{Z}\}$ then the
function $f: (\mathbb{R} - A) \rightarrow \mathbb{R}$ defined by $f(x) = \frac{1}{\cos x}$

Domain $f = \mathbb{R} - A$

$$\text{Range } f = \mathbb{R} - \{-1, 1\}$$

- If $A = \{x \in \mathbb{R} / x = n\pi; n \in \mathbb{Z}\}$ then the function

$$f: (\mathbb{R} - A) \rightarrow \mathbb{R} \text{ defined by } f(x) = \frac{1}{\sin x} = \operatorname{cosec} x$$

is called cosecant function.

Domain $f = \mathbb{R} - A$

$$\text{Range } f = \mathbb{R} - \{-1, 1\}$$

INSTITUTE FOR IAS/IIT/JEE EXAMINATION
NEW DELHI-110069
MOB: 09899197628

Boundedness of a function:

A function f is said to be bounded if its range is bounded. Otherwise it is unbounded i.e., A function f is said to be bounded on a domain D if there exist two real numbers h, k such that $h \leq f(x) \leq k \forall x \in D$ where h is called a lower bound of f . k is called an upper bound of f .

(or) A function f is said to be bounded on a domain D if there exist a real number M

such that $|f(x)| \leq M \forall x \in D$.

i.e., $M > 0$ such that $|f(x)| \leq M$ are bounded

Ex: $f(x) = \sin x, f(x) = \cos x$ are bounded functions on \mathbb{R}

But $f(x) = \tan x$ is not bounded on \mathbb{R} .

Cluster point of a set or limit point of a set:

Let $A \subseteq \mathbb{R}$. A point $c \in \mathbb{R}$ is a cluster point of A

if for every $\delta > 0$ there exists atleast one point

$x \in A, x \neq c$ such that $|x - c| < \delta$

i.e., $0 < |x - c| < \delta$.

(or) Let $A \subseteq \mathbb{R}$, A point $c \in \mathbb{R}$ is a cluster point of A if every δ -nbd of c contains atleast one point of A other than c .

i.e., $\delta > 0, (c-\delta, c+\delta)$ contains atleast one point of the set A other than c .

(or) A point $c \in \mathbb{R}$ is a cluster point of A if every

nbd of C contains infinitely many points of A :
 i.e., $\exists \delta > 0$, $(C - \delta, C + \delta)$ contains infinitely many points of A .

Eg: (1) for the open interval- $A_1 = (0, 1)$, every point of the closed interval $[0, 1]$ is a cluster point of A_1 .

The points 0 & 1 are cluster points of A_1 ,

but do not belong to A_1 .

All the points of A_1 are cluster points of A_1 .

(2) A finite set has no cluster points.

(3) The infinite set N has no cluster points.

(4) The set $A_4 = \left\{ \frac{1}{n} \mid n \in \mathbb{N} \right\}$ has only the point '0' as a cluster point.

None of the points in A_4 is a cluster point of A_4 .

Note: A cluster point of the set A may (or) may not belong to the set A .

(A real no. L is said to be a limit of f at x_0)
 (if given $\epsilon > 0$ (however small), $\exists \delta > 0$)

Limit of a function:

Let $A \subseteq \mathbb{R}$ and let C be a cluster point of A . for a function $f: A \rightarrow \mathbb{R}$, [a Real number L is said to be a limit of f at C ; if given any $\epsilon > 0$, there exists a $\delta > 0$ (depending on ϵ , i.e., $\delta(\epsilon)$) such that if $x \in A$ and $0 < |x - C| < \delta$ then

$$|f(x) - L| < \epsilon.$$

i.e., $|f(x) - L| < \epsilon$ whenever $0 < |x - C| < \delta$.

i.e., $\forall \epsilon > 0 \exists \delta > 0 \forall x \in (C - \delta, C + \delta); x \neq C$

Note: (1) If L is a limit of f at C , then we say f goes to L at C .

↳ Notes
↳ brief notes

rewrite $\lim_{x \rightarrow c} f(x) = L$ (or) $\lim_{x \rightarrow c} f = L$

we also say that $f(x)$ approaches L as
 x approaches c .
i.e. $f(x) \rightarrow L$ as $x \rightarrow c$.

- (2) If the limit of ' f ' at ' c ' does not exist,
we say that f diverges at c .
- (3) If ' c ' is not a cluster point of A then
the limit of a function ' f ' does not discuss
at ' c '.
- (4) The function f may (or) may not be
defined at the limit point.
Ex: If $A = (0, 1)$ and if $f: A \rightarrow \mathbb{R}$ then
 1 is a cluster point of A
but f is not defined at 1 .
Similarly at 0 .
- (5) In order to prove that $\lim_{x \rightarrow c} f(x) \neq L$, we have
to show that for any $\delta > 0$, and any $\epsilon > 0$
there is $x \in A$, $0 < |x - c| < \delta \Rightarrow |f(x) - L| \geq \epsilon$.
- (6) If $f: A \rightarrow \mathbb{R}$ and if ' c ' is a cluster point
of A then f can have only one limit at ' c '.

Sequential Criterion

Let $f: A \rightarrow \mathbb{R}$ and let ' c ' be a cluster point of
A then the following are equivalent.

$$(i) \lim_{x \rightarrow c} f(x) = L$$

i.e. for every (ϵ) in \mathbb{R} exists δ such that,

$a_n \neq c$ & $n \in \mathbb{N}$, the sequence $(f(a_n))$ goes to L .

→ Use the ϵ - δ definition of limit, to show that

$$\lim_{x \rightarrow c} \frac{1}{x} = \frac{1}{c}, \quad c > 0.$$

Soln: Let $f(x) = \frac{1}{x}; x > 0$

and let $c > 0$.

$$\text{To show that } \lim_{x \rightarrow c} f(x) = \frac{1}{c}.$$

for this we are enough to show that for any $\epsilon > 0; \exists \delta > 0$ (depends on ϵ) such that

$|f(x) - \frac{1}{c}| < \epsilon$ whenever $0 < |x - c| < \delta$.

$$\text{Now we have } |f(x) - \frac{1}{c}| = \left| \frac{1}{x} - \frac{1}{c} \right|$$

$$= \left| \frac{c - x}{xc} \right|$$

$$= \frac{|x - c|}{|xc|} \quad \text{--- (1)}$$

for $x \rightarrow c$,

by taking x sufficiently close to c
we have $0 < |x - c| < \frac{1}{2}c$. ($\because \delta \leq \frac{1}{2}c$)

$$\Rightarrow |x - c| > 0 \text{ and } |x - c| < \frac{1}{2}c.$$

$$x \neq c \text{ and } -\frac{1}{2}c < x - c < \frac{1}{2}c.$$

$$x \neq c \text{ and } -\frac{3}{2}c < x < \frac{3}{2}c.$$

$$x \neq c \text{ and } \frac{c}{2} < x.$$

$$x \neq c \text{ and } x < \frac{c^2}{2}$$

$$\text{and } |xc| > \frac{c^2}{2}$$

$$\text{and } \frac{|x - c|}{|xc|} < \frac{2}{c^2}$$

$$\therefore \text{--- (1)} \quad |f(x) - \frac{1}{c}| < \frac{2}{c^2} |x - c|$$

$$< \epsilon \text{ whenever } |x - c| < \frac{c^2 \epsilon}{2}$$

Choosing $\delta = \min\left\{\frac{1}{2}c, \frac{c^2}{2}\epsilon\right\}$

(5)

$\therefore |f(x) - \frac{1}{c}| < \epsilon$ whenever $0 < |x-c| < \delta$

$\therefore f(x) \rightarrow \frac{1}{c}$ as $x \rightarrow c$.

$\lim_{x \rightarrow c} f(x) = \frac{1}{c}; c > 0.$

$x \rightarrow c$ ~~as $x \neq c$~~

→ Use either the $\epsilon-\delta$ definition of limit (∞) or the sequential criterion for limits to establish the following limits.

$$(1) \lim_{x \rightarrow 2} \frac{1}{1-x} = -1 \quad (2) \lim_{x \rightarrow 1} \frac{x}{1+x} = \frac{1}{2}$$

$$(3) \lim_{x \rightarrow 0} \frac{x^2}{|x|} = 0 \quad (4) \lim_{x \rightarrow 1} \frac{x^2 - x + 1}{x+1} = \frac{1}{2}$$

Sol:

(i) $\epsilon-\delta$ Method.

Let $f(x) = \frac{1}{1-x}$. Then we prove that

$$\lim_{x \rightarrow 2} f(x) = -1.$$

for this we are enough to prove that for each $\epsilon > 0$ $\exists \delta > 0$ such that $|f(x) - (-1)| < \epsilon$ whenever $0 < |x-2| < \delta$.

we have

$$\begin{aligned} |f(x) - (-1)| &= \left| \frac{1}{1-x} - (-1) \right| \\ &= \left| \frac{1}{1-x} + 1 \right| \\ &= \left| \frac{2-x}{1-x} \right| \\ &= \left| \frac{x-2}{x-1} \right| \end{aligned}$$

$$\therefore |f(x) - (-1)| = \left| \frac{x-2}{x-1} \right| \quad (7)$$

for $\delta \rightarrow 2$,

by taking x sufficiently close to 2.

we have $0 < |x-2| < 1$ ($\because 0 < \delta \leq 1$)

$$\Rightarrow |x-2| > 0 \text{ and } |x-2| < 1$$

$$\Rightarrow x \neq 2 \text{ and } -1 < x-2 < 1$$

$$\Rightarrow x \neq 2 \text{ and } 2-1 < x < 2+1 \\ \text{i.e., } 1 < x < 3$$

Since $x > 1$

$$\Rightarrow x-1 > 0 \Rightarrow \frac{1}{x-1} > 0$$

$$\Rightarrow \left| \frac{1}{x-1} \right| > 0$$

$$\Rightarrow 0 < \left| \frac{1}{x-1} \right| \leq 1$$

$$\Rightarrow \frac{1}{|x-1|} \leq 1$$

$$\therefore ① = |f(x) - (-1)| \leq \frac{1}{|x-1|} \\ < \epsilon \text{ whenever } |x-2| < \frac{\epsilon}{1}$$

$$\text{choosing } \delta = \min \left\{ 1, \frac{\epsilon}{1} \right\}$$

$$\therefore |f(x) - (-1)| < \epsilon \text{ whenever } 0 < |x-2| < \delta$$

$$\therefore f(x) \rightarrow -1 \text{ as } x \rightarrow 2$$

$$\therefore \underset{x \rightarrow 2}{\lim} f(x) = -1$$

Sequential Method:

$$\text{Let } f(x) = \frac{1}{1-x}; c=2$$

$$\text{Take } x_n = \frac{2n}{n+1} \rightarrow n \in \mathbb{N}$$

$$\therefore \lim x_n = 2$$

$$n \rightarrow \infty$$

$$\begin{aligned} f(x_n) &= \frac{1}{1-x_n} \\ &= \frac{1}{1-\frac{2n}{n+1}} = \frac{n+1}{n-1} \end{aligned}$$

$$\lim_{n \rightarrow \infty} f(x_n) = \lim_{n \rightarrow \infty} \left(\frac{1+n}{1-n} \right)$$

$$= \lim_{n \rightarrow \infty} \left(\frac{\frac{1}{n} + 1}{\frac{1}{n} - 1} \right)$$

$$= \frac{0+1}{0-1} = -1$$

\therefore The sequence $(f(x_n))$ cgs to $-1 = L$

$$\therefore \lim f(x) = L$$

$$\begin{aligned} & x \rightarrow 2 \\ & \Rightarrow \lim_{x \rightarrow 2} f(x) = -1 \end{aligned}$$

(3) By $\epsilon-\delta$ method:

$$\begin{aligned} \left| \frac{x^2}{|x|} - 0 \right| &= \frac{|x^2|}{|x|} \\ &= \frac{|x|^2}{|x|} \\ &= |x| < \epsilon \text{ (say)} \end{aligned}$$

$\therefore \left| \frac{x^2}{|x|} - 0 \right| < \epsilon$ whenever $|x| < \delta = \epsilon$.

$\forall \epsilon > 0$, $\exists \delta = \epsilon > 0$ such that

$\left| \frac{x^2}{|x|} - 0 \right| < \epsilon$ whenever $|x - 0| < \delta$.

$$\begin{aligned} & \left| \frac{x^2}{|x|} - 0 \right| \\ & x \rightarrow 0 \end{aligned}$$

Divergence Criteria: Let $f: A \rightarrow \mathbb{R}$ and let $c \in \mathbb{R}$ be a cluster point of A .

(a) If $L \in \mathbb{R}$ then f does not have limit L at c iff there exists a sequence (x_n) in A with $x_n \neq c$ such that the sequence (x_n) cgs to c but the sequence $(f(x_n))$ does not converge to L .

b) The function f does not have a limit at c iff there exists a sequence (x_n) in A with $x_n \neq c$ $\forall n$ such that the sequence (x_n) goes to c but the sequence $(f(x_n))$ does not converge in \mathbb{R} .

e.g. $\lim_{x \rightarrow 0} \frac{1}{x}$ does not exist in \mathbb{R} .

$$\text{Soln: Let } f(x) = \frac{1}{x}; c=0$$

$$\text{Let } x_n = \frac{1}{n} \quad \forall n$$

$$\text{then } \lim_{n \rightarrow \infty} x_n = 0 = c$$

$\therefore (x_n)$ goes to 0 ?

$$\text{Now } f(x_n) = \frac{1}{x_n} = \frac{1}{\frac{1}{n}} = n \quad \forall n$$

$$\therefore \lim_{n \rightarrow \infty} f(x_n) = \lim_{n \rightarrow \infty} n = +\infty$$

$\therefore (f(x_n))$ is not cpt in \mathbb{R} .

$\therefore \lim_{x \rightarrow 0} f(x)$ does not exist in \mathbb{R} .

→ Show that the following limits do not exist.

$$(a) \lim_{x \rightarrow 0} \frac{1}{x^2} \quad (b) \lim_{x \rightarrow 0} \frac{1}{\sqrt{x}}$$

$$(c) \lim_{x \rightarrow 0} \operatorname{sgn}(x) \quad (d) \lim_{x \rightarrow 0} (x + \operatorname{sgn}(x)) \quad (e) \lim_{x \rightarrow 0} \sin\left(\frac{1}{x}\right)$$

$$(f) \lim_{x \rightarrow 0} \sin\left(\frac{1}{x}\right)$$

$$\text{Soln: (c) } \lim_{x \rightarrow 0} \operatorname{sgn}(x)$$

$$\text{Let } f(x) = \operatorname{sgn}(x) = \begin{cases} +1 & \text{if } x > 0 \\ 0 & \text{if } x = 0 \\ -1 & \text{if } x < 0 \end{cases}$$

$$\text{Now, } \operatorname{sgn}(x) = \frac{|x|}{x} \text{ if } x \neq 0.$$

Now we have to show that $\text{sgn}(x)$ does not have a limit at $x=0$. (7)

$$\text{Let } x_n = \frac{(-1)^n}{n} \quad \forall n \quad \text{then} \quad \lim_{n \rightarrow \infty} x_n = 0$$

$\therefore (x_n) \text{ cons to } 0$.

$$\text{Now } \text{sgn}(x_n) = \frac{(-1)^n/n}{|(-1)^n/n|} = (-1)^n \quad \forall n$$

$$\therefore \lim_{n \rightarrow \infty} \text{sgn}(x_n) = \begin{cases} +1 & \text{if } n \text{ is odd} \\ -1 & \text{if } n \text{ is even} \end{cases}$$

$\therefore \text{sgn}(x_n)$ does not converge.

$\therefore \lim_{n \rightarrow 0} \text{sgn}(x)$ does not exist.

$$(e) \quad \lim_{x \rightarrow 0} \sin\left(\frac{1}{x}\right)$$

$$\text{Let } f(x) = \sin\left(\frac{1}{x}\right); \quad c=0$$

By introducing

$$\text{Let } x_n = \frac{1}{n\pi} \quad \forall n$$

$$\text{Then } \lim_{n \rightarrow \infty} x_n = 0$$

$$\text{Now } f(x_n) = \sin(n\pi) \\ = 0 \quad \forall n$$

$$\therefore \lim_{n \rightarrow \infty} f(x_n) = 0$$

two sequences (x_n) & (y_n) .

$$\text{and let } y_n = \frac{1}{\frac{1}{2}\pi + 2n\pi}$$

$$\text{Then } \lim_{n \rightarrow \infty} y_n = 0$$

$$\text{Now } f(y_n) = \sin\left(\frac{1}{\frac{1}{2}\pi + 2n\pi}\right)$$

$$= \sin\left(\frac{1}{\pi} + \frac{4n}{\pi}\right)$$

$$= \frac{1}{\pi} \rightarrow \infty$$

$$\therefore \lim_{n \rightarrow \infty} f(y_n) = 1$$

$$\lim_{n \rightarrow \infty} f(x_n) \neq \lim_{n \rightarrow \infty} f(y_n)$$

$\therefore \lim_{x \rightarrow 0} f(x)$ does not exist.

$$(f) \quad \lim_{x \rightarrow 0} \sin\left(\frac{1}{x^2}\right)$$

$$\text{Let } f(x) = \sin\left(\frac{1}{x^2}\right); \quad c=0$$

$$\text{Let } x_n = \frac{1}{n}$$

Algebra of limits:

Let $A \subseteq \mathbb{R}$. Let f & g be two functions on A to \mathbb{R} .
and $c \in \mathbb{R}$ be a cluster point of A . further

let $b \in \mathbb{R}$ if $\lim_{x \rightarrow c} f = L$ and $\lim_{x \rightarrow c} g = M$.

$$\text{then (i) } \lim_{x \rightarrow c} (f \pm g) = L \pm M \quad \begin{aligned} \text{if } \lim_{x \rightarrow c} |x| = \lim_{x \rightarrow c} |f(x)| \\ = |L| \end{aligned}$$

$$\text{(ii) } \lim_{x \rightarrow c} (fg) = LM$$

$$\text{(iii) } \lim_{x \rightarrow c} (bf) = bL \quad \text{(iv) } \lim_{x \rightarrow c} \left(\frac{f}{g}\right) = \frac{L}{M} \text{ provided } M \neq 0$$

Theorem Let $A \subseteq \mathbb{R}$, let $f: A \rightarrow \mathbb{R}$ and let $c \in \mathbb{R}$ be
a cluster point of A .

$$\text{If } a \leq f(x) \leq b \quad \forall x \in A; x \neq c$$

$$\text{and } \lim_{x \rightarrow c} f(x) \text{ exists.}$$

$$\text{then } a \leq \lim_{x \rightarrow c} f(x) \leq b.$$

Squeeze theorem:

Let $A \subseteq \mathbb{R}$, let $f, g, h: A \rightarrow \mathbb{R}$ and let $c \in \mathbb{R}$ be
a cluster point of A . if $f(x) \leq g(x) \leq h(x) \quad \forall x \in A; x \neq c$.

$$\text{and if } \lim_{x \rightarrow c} f(x) = L = \lim_{x \rightarrow c} h(x)$$

$$\text{then } \lim_{x \rightarrow c} g(x) = L$$

Note: if $x \in \mathbb{R}, x \geq 0$ then

$$\text{we have (i) } -x \leq \sin x \leq x$$

$$\text{(ii) } 1 - \frac{1}{2}x^2 \leq \cos x \leq 1$$

$$\text{(iii) } x - \frac{1}{6}x^3 \leq \sin x \leq x$$

$$\text{(iv) } 1 - \frac{1}{2}x^2 \leq \cos x \leq 1 - \frac{1}{2}x^2 + \frac{1}{2}x^4$$

Here $\sin x = \sin x - \cos x = C(x)$

Sol: Let $-1 \leq C(t) \leq 1 \forall t \in \mathbb{R}$

(8)

If $x > 0$ then

$$-\int_{t=0}^x dt \leq \int_0^x C(t) dt \leq \int_0^x dt$$

$$\Rightarrow -x \leq S(x) \leq x$$

Integrating, we get

$$-\frac{x^2}{2} \leq -\cos x + 1 \leq \frac{x^2}{2}$$

$$\Rightarrow -\frac{x^2}{2} \leq \cos x - 1 \leq \frac{x^2}{2}$$

$$\Rightarrow 1 - \frac{x^2}{2} \leq \cos x \leq 1 + \frac{x^2}{2}$$

$$\Rightarrow 1 - \frac{x^2}{2} \leq \cos x \leq 1 \quad (\text{range of cos } \leq 1)$$

and so on.

Problems

$$\rightarrow \lim_{x \rightarrow 0} x^{3/2} = 0; (x > 0)$$

$x > 0$

$$\text{Sol: Let } g(x) = x^{3/2}; x > 0$$

We have $x < x^{3/2} \leq 1$ for $0 < x \leq 1$

$$\Rightarrow x < x^{3/2} \leq x \text{ for } 0 < x \leq 1$$

is of the form $f(x) \leq g(x) \leq h(x)$.

Where $f(x) = x^2$, $g(x) = x^{3/2}$; $h(x) = x$.

$$\therefore \lim_{\substack{x \rightarrow 0 \\ x > 0}} f(x) = 0 = \lim_{\substack{x \rightarrow 0 \\ x > 0}} h(x)$$

By squeeze theorem

$$\lim_{x \rightarrow 0} g(x) = 0$$

$$\rightarrow \lim_{x \rightarrow 0} \sin x = 0$$

Since $-x \leq \sin x \leq x \forall x \neq 0$.

is of the form $f(x) = -x$; $g(x) = \sin x$; $h(x) = x$.

$$\therefore \lim_{\substack{x \rightarrow 0 \\ x > 0}} f(x) = 0 = \lim_{\substack{x \rightarrow 0 \\ x > 0}} h(x)$$

\therefore By squeeze theorem $\lim_{x \rightarrow 0} g(x) = 0$.

$$\Rightarrow \lim_{x \rightarrow 0} \cos x = 1.$$

Sol: Since $1 - \frac{x^2}{2} \leq \cos x \leq 1$

$$\Rightarrow \lim_{x \rightarrow 0} \left(\frac{\cos x - 1}{x} \right) = 0$$

Sol: Since $1 - \frac{x^2}{2} \leq \cos x \leq 1 \quad \forall x > 0$

$$\Rightarrow -\frac{x^2}{2} \leq \cos x - 1 \leq 0$$

$$\Rightarrow -\frac{x}{2} \leq \frac{\cos x - 1}{x} \leq 0.$$

is of the form $f(x) \leq g(x) \leq h(x)$

$$\text{where } f(x) = -\frac{x}{2} \text{ ; } g(x) = \frac{\cos x - 1}{x}$$

and $h(x) = 0$.

$$\therefore \lim_{x \rightarrow 0} f(x) = 0 = \lim_{x \rightarrow 0} h(x)$$

\therefore By squeeze theorem

$$\lim_{x \rightarrow 0} g(x) = 0$$

$$\Rightarrow \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

Sol: Since $x - \frac{x^3}{6} \leq \sin x \leq x \quad \forall x > 0$

$$\Rightarrow 1 - \frac{x^2}{6} \leq \frac{\sin x}{x} \leq 1 \quad \forall x > 0$$

is of the form $f(x) \leq g(x) \leq h(x)$

$$\text{where } f(x) = 1 - \frac{x^2}{6}; \quad g(x) = \frac{\sin x}{x}$$

and $h(x) = 1$

$$\therefore \lim_{x \rightarrow 0} f(x) = 1 = \lim_{x \rightarrow 0} h(x)$$

\therefore By squeeze theorem

$$\lim_{x \rightarrow 0} g(x) = 1$$

$$\therefore \lim_{x \rightarrow 0} \left(x \sin \frac{1}{x} \right) = ?$$

ans. Let $f(x) = x \sin \frac{1}{x}$

Since $-1 \leq \sin \frac{1}{x} \leq 1 ; x \neq 0$

$$\Rightarrow -x \leq x \sin \frac{1}{x} \leq x ; x \neq 0$$

is of the form $f(x) \leq g(x) \leq h(x)$

where $f(x) = -x ; g(x) = x \sin \frac{1}{x}$ and $h(x) = x$

$$\therefore \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} h(x) = 0$$

∴ By squeeze theorem,

$$\lim_{x \rightarrow 0} g(x) = 0$$

$$\lim_{x \rightarrow 0} x \sin \left(\frac{1}{x} \right) = ? ; x \neq 0$$

$$\lim_{x \rightarrow 0} \operatorname{sgn} \left(\sin \frac{1}{x} \right) = ?$$

Soln: Let $f(x) = \operatorname{sgn} \left(\sin \frac{1}{x} \right) ; x \neq 0$

$$= \frac{\sin \frac{1}{x}}{|\sin \frac{1}{x}|} ; x \neq 0$$

Since $\lim_{x \rightarrow 0} \sin \frac{1}{x}$ does not exist.

$$x \rightarrow 0$$

∴ $\lim_{x \rightarrow 0} \operatorname{sgn} \left(\sin \frac{1}{x} \right)$ does not exist.

$$x \rightarrow 0$$

One-Sided Limits:

Let $A \subseteq \mathbb{R}$ and $f: A \rightarrow \mathbb{R}$
 if $c \in \mathbb{R}$ is a cluster point of the set

$$A \cap (c, \infty) = \{x \in A / x > c\}$$

then we say that L_c^+ is a right-hand limit

of f at c if given $\epsilon > 0$; $\exists \delta > 0$ such that

$x \in A$ with $0 < x - c < \delta$, then $|f(x) - L| < \epsilon$.

i.e., $|f(x) - L| < \epsilon$ whenever $0 < x - c < \delta$.

The right-hand limit (RHL) is denoted by

$$\lim_{x \rightarrow c^+} f(x) \quad (\text{or}) \quad \lim_{x \rightarrow c^+} f$$

(ii) If $c \in \mathbb{R}$ is a cluster point of the set

$$A \cap (-\infty, c) = \{x \in A / x < c\},$$

then we say that $L \in \mathbb{R}$ is a left-hand limit of f at c .

If given any $\epsilon > 0$, if a $\delta > 0$ such that

for all $x \in A$ with $0 < c-x < \delta$, then $|f(x)-L| < \epsilon$

i.e., $|f(x)-L| < \epsilon$ whenever $0 < c-x < \delta$.

The left-hand limit (LHL) is denoted by

$$\underset{x \rightarrow c^-}{\text{LH}} f(x) \quad (\text{or}) \quad \underset{x \rightarrow c^-}{\text{LT}} f.$$

Existence of a limit

$$\text{If } \underset{x \rightarrow c}{\text{f}(x)} = L \iff \underset{x \rightarrow c^+}{\text{LT}} f(x) = L = \underset{x \rightarrow c^-}{\text{LT}} f(x)$$

Sequential criteria

Let $A \subseteq \mathbb{R}$, let $f: A \rightarrow \mathbb{R}$ and let $c \in \mathbb{R}$ be a cluster point of $A \cap (c, \infty)$ then the following statements are equivalent.

$$(i) \underset{x \rightarrow c^+}{\text{LT}} f(x) = L$$

$$(ii) \text{for every sequence } (x_n) \text{ that converges to } c \text{ such that } x_n \in A \text{ and } x_n > c \text{ then, the sequence } (f(x_n)) \text{ converges to } L.$$

In this way for left-hand limit.

Example:

$$\rightarrow \underset{x \rightarrow 0^+}{\text{LT}} \text{sgn}(x) = ?$$

$$\text{Sol: Let } f(x) = \text{sgn}(x); x \neq 0.$$

$$= \frac{x}{|x|}, x \neq 0$$

$$= 1 \text{ if } x > 0$$

Now $\lim_{x \rightarrow 0^+} f(x) = 1$ & $\lim_{x \rightarrow 0^-} f(x) = -1$

(16)

$\therefore \lim_{x \rightarrow 0^+} f(x) \neq \lim_{x \rightarrow 0^-} f(x)$

$\therefore \lim_{x \rightarrow 0} f(x)$ does not exist.

$\rightarrow \lim_{x \rightarrow 0} \sin\left(\frac{1}{x}\right) = ?$

Let $f(x) = \sin\left(\frac{1}{x}\right); x \neq 0$ (i.e. $x < 0$ or $x > 0$)

LHL:

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \sin\frac{1}{x}$$

Now $x \rightarrow 0^+$, $\sin\frac{1}{x}$ is finite and oscillates
(i.e. $x > 0$) between $-1 \text{ & } 1$.

\therefore It does not tend to any unique number.

$\therefore \lim_{x \rightarrow 0^+} \sin\frac{1}{x}$ does not exist.

Similarly, $\lim_{x \rightarrow 0^-} \sin\frac{1}{x}$ does not exist.

$\therefore \lim_{x \rightarrow 0} \sin\frac{1}{x}$ does not exist.

$\rightarrow \lim_{x \rightarrow 0} x \sin\frac{1}{x} = ?$

Soln: Let $f(x) = x \sin\frac{1}{x}; x \neq 0$

LHL: $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} x \sin\frac{1}{x}$

$$= 0 \times [\text{finite number between } -1 \text{ & } 1] \\ = 0$$

RHL: $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} x \sin\frac{1}{x}$

$$= 0 \times (\text{finite number between } -1 \text{ & } 1) \\ = 0$$

$\therefore \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} f(x) = 0$

$\therefore \lim_{x \rightarrow 0} f(x) = 0$

Limits at infinity and Infinite limits :-

(i) $\lim_{x \rightarrow \infty} f(x) = L$.

A function $f(x)$ is said to tend to 'L' as $x \rightarrow \infty$, if given any $\epsilon > 0$ (however small), \exists a +ve number K (depends on ϵ) such that $x \geq K \Rightarrow |f(x) - L| < \epsilon$.

(ii) $\lim_{x \rightarrow -\infty} f(x) = L$.

A function $f(x)$ is said to tend to L as $x \rightarrow -\infty$, if given any $\epsilon > 0$, \exists a +ve number K (depends on ϵ) such that $x \leq -K \Rightarrow |f(x) - L| < \epsilon$.

(iii) $\lim_{x \rightarrow c} f(x) = +\infty$.

A function $f(x)$ is said to tend to ∞ as $x \rightarrow c$, if given any $K > 0$ (however large), \exists a +ve number δ such that $0 < |x - c| < \delta \Rightarrow f(x) > K$.

(iv) $\lim_{x \rightarrow c} f(x) = -\infty$.

A function $f(x)$ is said to tend to $-\infty$ as $x \rightarrow c$, if given $K > 0$ (however large), \exists a $\delta > 0$ such that $0 < |x - c| < \delta \Rightarrow f(x) < -K$.

(v) $\lim_{x \rightarrow \infty} f(x) = +\infty$.

A function $f(x)$ is said to tend to $+\infty$ as $x \rightarrow \infty$, if given any $K > 0$ (however large), \exists a number $K' > 0$ such that $x \geq K' \Rightarrow f(x) > K$.

(vi) $\lim_{x \rightarrow \infty} f(x) = -\infty$.

A function $f(x)$ is said to tend to $-\infty$ as $x \rightarrow \infty$, if given any $K > 0$ (however large), \exists a number $K' > 0$ such that $x \geq K' \Rightarrow f(x) < -K$.

(vii) $\lim_{x \rightarrow -\infty} f(x) = \infty$.

A function $f(x)$ is said to tend to ∞ as $x \rightarrow -\infty$, if given any $K > 0$ (however large), \exists a number $K' > 0$ such that $x \leq -K' \Rightarrow f(x) > K$.

(viii) $\lim_{x \rightarrow -\infty} f(x) = -\infty$.

A function $f(x)$ is said to tend to $-\infty$ as $x \rightarrow -\infty$, if given any $K > 0$ (however large), \exists $K' > 0$ (depends on K) such that $x \leq -K' \Rightarrow f(x) < -K$.

Continuous functions:

Let $A \subseteq \mathbb{R}$, $f: A \rightarrow \mathbb{R}$ and $c \in A$ be a cluster point of A then we say that ' f ' is continuous at ' c ' if $\lim_{x \rightarrow c} f(x) = f(c)$

$$\text{(or) } \lim_{x \rightarrow c^-} f(x) = \lim_{x \rightarrow c^+} f(x) = f(c)$$

(or)

Let $A \subseteq \mathbb{R}$, $f: A \rightarrow \mathbb{R}$ and $c \in A$ be a cluster point of A then we say that f is continuous at ' c ' if given $\epsilon > 0$, \exists a $\delta > 0$ (depending on ϵ) such that if $x \in A$ satisfying $|x - c| \leq \delta$ then $|f(x) - f(c)| < \epsilon$. i.e., $|f(x) - f(c)| < \epsilon$ whenever $|x - c| < \delta$. i.e., $f(x) \in (f(c) - \epsilon, f(c) + \epsilon)$ $\Rightarrow x \in (c - \delta, c + \delta)$

Continuous from the left at a point:

A function f is continuous from the left

(or left-continuous) at the point $x = c$ if $\lim_{x \rightarrow c^-} f(x) = f(c)$.

(or)

Let $A \subseteq \mathbb{R}$, let $f: A \rightarrow \mathbb{R}$, $c \in A$ is a cluster point of $A \cap (-\infty, c]$ then we

say that f is left continuous at ' c ' ,

if given any $\epsilon > 0$ (however small),

$\exists \delta > 0$ (depends on ϵ) such that

$$c - \delta < x \leq c \Rightarrow |f(x) - f(c)| < \epsilon$$

Continuity from the right at a point

A function f is continuous from the right (or) right continuous at the point

$$\begin{aligned} x = c &\text{ if } \lim_{x \rightarrow c^+} f(x) = f(c) \\ &\text{(or)} \end{aligned}$$

Let $A \subset \mathbb{R}$, let $f: A \rightarrow \mathbb{R}$, $c \in A$ is a cluster point of $A \cap [c, \infty) = \{x \in A / x \geq c\}$

then we say that f is right continuous at ' c ', if given any $\epsilon > 0$ (however small)

$\exists \delta > 0$ (depends on ϵ) such that

$$c \leq x < c + \delta \Rightarrow |f(x) - f(c)| < \epsilon$$

Discontinuity

If f is not continuous at ' c '
then f is said to be discontinuous at ' c '

$$\text{i.e., } \lim_{x \rightarrow c} f(x) \neq f(c)$$

(or)

 $A \subseteq \mathbb{R}$, let $f: A \rightarrow \mathbb{R}$; $c \in A$ is a cluster pointof A then f is not continuous at c , if $\epsilon > 0$, $\exists \delta > 0$ s.t. x is any point of A satisfying $|x - c| < \delta \Rightarrow$

$$|f(x) - f(c)| \geq \epsilon$$

NOTE:- (i) If c is acluster point of A then
the following three

conditions must hold for

 f to be continuous at c (i) f should be defined at c
(i.e. $f(c)$ exists).(ii) $\lim_{x \rightarrow c} f(x)$ exists and(iii) $f(c) = \lim_{x \rightarrow c} f(x)$ are
equal.(2) f is discontinuousat $x=c$ because of
any one of the following
reason:(i) f is not defined at c (ii) $\lim_{x \rightarrow c} f(x)$ does not existi.e. $\lim_{x \rightarrow c^-} f(x) \neq \lim_{x \rightarrow c^+} f(x)$
(say)one of the limit does
not exist or

both of the limits do not exist.

(iii) $\lim_{x \rightarrow c} f(x) \neq f(c)$ iff (12)

but are not equal.

⇒ Sequential Criterion
for continuity.A function $f: A \rightarrow \mathbb{R}$
is continuous at the point
 $c \in A$ iff for every sequence
(a_n) in A that $\text{cgs to } c$, the
sequence ($f(a_n)$) $\text{cgs to } f(c)$.⇒ Discontinuity criterionLet $A \subseteq \mathbb{R}$ and let $f: A \rightarrow \mathbb{R}$,
let $c \in A$. Then f is
discontinuous at c iff
there exists a sequence (a_n)
in A that $\text{cgs to } c$,
but the sequence ($f(a_n)$)
does not converge to $f(c)$.Let $A \subseteq \mathbb{R}$ and let $f: A \rightarrow \mathbb{R}$.if $B \subseteq A$, we say that
 f is continuous on the set B
if f is continuous at every
point of B .

Continuity in an open interval :-

If function f is said to be continuous for an open interval (a, b) , if it is continuous at every point of (a, b) .

$$\text{i.e. } \lim_{x \rightarrow c} f(x) = f(c), \quad x \in (a, b)$$

continuity in a closed interval

A function f is said to be continuous in a closed interval $[a, b]$ if it is

- (i) right conti at ' a ' i.e. $\lim_{x \rightarrow a^+} f(x) = f(a)$

(ii) left conti at ' b ' i.e. $\lim_{x \rightarrow b^-} f(x) = f(b)$

(iii) conti in (a, b)

$$\text{i.e. } \lim_{x \rightarrow c} f(x) = f(c), \quad x \in (a, b)$$

→ A function which is not continuous even at a single point of an interval is said to be discontinuous in that interval.

The types of Discontinuity

1. Removable discontinuity:-

If $\lim_{x \rightarrow c} f(x)$ exists but is not equal to $f(c)$ then f is

said to be removable discontinuity at ' c '

$$\text{i.e. } \lim_{x \rightarrow c} f(x) \neq f(c)$$

Ex:- ①

$$f(x) = \begin{cases} \frac{\sin x}{x} & \text{if } x \neq 0 \\ 2 & \text{if } x=0 \end{cases}$$

Sol

$$\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

$x \neq 0,$

$$f(x) = 2$$

$$\therefore \lim_{x \rightarrow 0} f(x) \neq f(0)$$

Ex:- ②

$$f(x) = \begin{cases} x^2 - 2 & \text{if } x > 2 \\ 4 - x & \text{if } x \leq 2 \\ 1 & \text{if } x = 2 \end{cases}$$

Sol LHL

$$\lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} (4 - x) = 4 - 2 = 2$$

RHL

$$\lim_{x \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} x^2 - 2 = 4 - 2 = 2$$

at $x = 2$

$$f(2) =$$

$$\therefore (\lim_{x \rightarrow 2} f(x) \neq f(2))$$

(2) Discontinuity of first kind (or)
jump discontinuity (or)

Ordinary discontinuity:

If $\lim_{x \rightarrow c^-} f(x)$ and $\lim_{x \rightarrow c^+} f(x)$

both exist but are not equal and $f(c)$ exists,
it is equal to the either
(or) neither of $\lim_{x \rightarrow c^-} f(x)$ (or)

$\lim_{x \rightarrow c^+} f(x)$ then f is called
discontinuity of first kind.

$\rightarrow f$ is said to be
discontinuity of first
kind from the left at
 c if $\lim_{x \rightarrow c^-} f(x)$ exists but
it is not equal to $f(c)$.

$\rightarrow f$ is said to be
discontinuity of the
first kind from right at
 c if $\lim_{x \rightarrow c^+} f(x)$ exists but
is not equal to $f(c)$.

$$\text{Ex:- } f(x) = \begin{cases} x & \text{if } x > 2 \\ 3-x & \text{if } x < 2 \\ 1 & \text{if } x=2 \end{cases}$$

(3) Disconti. of second kind: (13)

\rightarrow If $\lim_{x \rightarrow c^-} f(x)$ & $\lim_{x \rightarrow c^+} f(x)$

both do not exist they
f is called discontinuity of second
kind.

$\rightarrow f$ is said to be a
discontinuity of the second kind
from the left at c if
 $\lim_{x \rightarrow c^-} f(x)$ does not exist.

$\rightarrow f$ is said to be a
discontinuity of the second kind
from the right at c if
 $\lim_{x \rightarrow c^+} f(x)$ does not exist.

$$\text{Ex:- } f(x) = \begin{cases} \sin(\frac{1}{x}) & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases}$$

so) LHL

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \sin\left(\frac{1}{x}\right)$$

$$= l \quad (\because -1 \leq l \leq 1)$$

$\therefore l$ is finite number
but it is not fixed because
l rotates with -1 to 1 .

\therefore $\lim_{x \rightarrow 0^-} f(x)$ does not exist

Right RHL does not exist

(4) Mixed discontinuity:-

If a function f has discontinuity of the second kind on one side of c and other side a discontinuity of first kind.

(or) may be continuous.
 Then f is called a mixed discontinuity at c .
 (or)

If one of the limits $\lim_{x \rightarrow c^-} f(x)$ & $\lim_{x \rightarrow c^+} f(x)$ exist but not the other then f is called mixed discontinuous at c .

i.e. $\lim_{x \rightarrow c^-} f(x)$ does not exist and $\lim_{x \rightarrow c^+} f(x)$ exists and may (or) may not equal to $f(c)$.

(or)
 $\lim_{x \rightarrow c^+} f(x)$ does not exist and $\lim_{x \rightarrow c^-} f(x)$ exists and may (or) may not equal to $f(c)$.

$$\text{Ex: } f(x) = \begin{cases} \sin \frac{1}{x} & \text{if } x > 0 \\ 2 & \text{if } x = 0 \\ 0 & \text{if } x < 0 \end{cases}$$

Q1

(5) Infinite discontinuity:-

If one (∞) both limits $\lim_{x \rightarrow c^-} f(x)$ & $\lim_{x \rightarrow c^+} f(x)$ are ∞ then f is called infinite discontinuity i.e.

$$\text{Ex: } f(x) = \begin{cases} \frac{1}{x-2} & \text{if } x \neq 2 \\ 0 & \text{if } x = 2 \end{cases}$$

SJ

Algebra of continuous functions:-

If $f(x)$ & $g(x)$ are continuous functions at $x=c$ then $\lim_{x \rightarrow c} f(x) = f(c)$ & $\lim_{x \rightarrow c} g(x) = g(c)$.

$$(i) \lim_{x \rightarrow c} (f \pm g)(x) = \lim_{x \rightarrow c} (f(x) \pm g(x)) \\ = \lim_{x \rightarrow c} f(x) \pm \lim_{x \rightarrow c} g(x) \\ = f(c) \pm g(c).$$

$$(ii) \lim_{x \rightarrow c} (f \cdot g)(x) = \lim_{x \rightarrow c} (f(x) \cdot g(x)) \\ = \lim_{x \rightarrow c} f(x) \cdot \lim_{x \rightarrow c} g(x) \\ = f(c) \cdot g(c).$$

$$(iii) \lim_{x \rightarrow c} (f/g)(x) = \lim_{x \rightarrow c} [f(x)/g(x)] \\ = \lim_{x \rightarrow c} f(x) / \lim_{x \rightarrow c} g(x) \quad \text{... if } g(c) \neq 0$$

$$\begin{aligned}
 \text{(iv)} \quad & \lim_{x \rightarrow c} \frac{f\left(\frac{x}{g}\right)}{g(x)} = \frac{\lim f(x)}{\lim g(x)} \\
 &= \frac{\lim f(x)}{\lim x} \\
 &= \frac{\lim g(x)}{x \rightarrow c} \\
 &= \frac{f(c)}{g(c)} \\
 &= \left(\frac{f}{g}\right)(c) \\
 &\text{provided } g \neq 0.
 \end{aligned}$$

problems

using $\epsilon-\delta$ definition,
prove that

(i) $f(x) = 3x + 1$ is continuous
at $x=2$

$$\text{(ii)} \quad f(x) = \begin{cases} \frac{x-4}{x-2} & \text{if } x \neq 2 \\ 4 & \text{if } x=2 \end{cases}$$

$$\text{sol} \quad \text{(i)} \quad f(x) = 3x + 1;$$

$$\begin{aligned}
 &\text{at } x=2 \\
 &f(2) = 3(2) + 1 \\
 &= 7.
 \end{aligned}$$

Let $\epsilon > 0$ be given.

we have

$$\begin{aligned}
 |f(x) - f(2)| &= |3x + 1 - 7| \\
 &= |3x - 6| \\
 &= 3|x - 2| \leq \epsilon \\
 &\text{whenever } |x - 2| \leq \frac{\epsilon}{3}
 \end{aligned}$$

If we choose $\delta = \frac{\epsilon}{3}$, then

$$|f(x) - f(2)| \leq \epsilon \text{ whenever } |x - 2| < \delta$$

$f(x)$ is conti. at $x=2$.

$$\text{(ii)} \quad f(x) = \frac{x-4}{x-2} \quad \text{if } x \neq 2$$

$$\text{at } x=2; \quad f(2) = 4.$$

Let $\epsilon > 0$ be given.

(14)

Now we have

$$|f(x) - f(2)| = \left| \frac{x-4}{x-2} - 4 \right|$$

$$= \left| \frac{x^2 - 4x - 4x + 8}{x-2} \right|$$

$$= \left| \frac{x^2 - 4x + 4}{x-2} \right|$$

$$= |x-2| \leq \epsilon$$

whenever $|x-2| \leq \epsilon$

Choosing $\delta = \epsilon$,

$$|f(x) - f(2)| \leq \epsilon \text{ whenever } |x-2| \leq \epsilon$$

$f(x)$ is conti. at $x=2$.

→ the constant function

$$f(x) = b \text{ is conti. on } \mathbb{R}$$

→ $g(x) = x$ is conti. on \mathbb{R} .

→ $h(x) = x^2$ is conti. on \mathbb{R} .

→ $\phi(x) = \frac{1}{x}$ is conti. on $x \in \mathbb{R} \setminus \{0\}$

$$\text{sol} \quad \text{Let } x = \text{const.}$$

$$\text{then } \phi(x) = \frac{1}{x}$$

$$\text{and } \lim_{x \rightarrow c} \phi(x) = \frac{1}{c}$$

$$\therefore \lim_{x \rightarrow c} \phi(x) = \phi(c).$$

$\phi(x)$ is conti. at $x=c$.

$\phi(c) = \frac{1}{2}$ is not conti
 $\forall x=0$

because

ϕ is not defined at
 $x=0$ and

$\lim_{x \rightarrow 0} \phi$ does not exist

\rightarrow the signum function sgn
is not conti. at $x=0$

Sol

Let $f(x) = \text{sgn}(x)$

$$= \begin{cases} -1 & \text{if } x < 0 \\ 0 & \text{if } x = 0 \\ +1 & \text{if } x > 0 \end{cases}$$

$\lim_{x \rightarrow 0^-} f(x) = -1$ & $\lim_{x \rightarrow 0^+} f(x) = 1$

$\therefore \lim_{x \rightarrow 0} f(x) \neq \lim_{x \rightarrow 0} f(x)$

$\therefore \lim_{x \rightarrow 0} f(x)$ does not exist.

$\therefore f(x)$ is not conti. at $x=0$.

Ques

Let $A = \mathbb{R}$ and

let $f: A \rightarrow \mathbb{R}$ defined

$$y = f(x) = \begin{cases} 1 & \text{if } x \text{ is rational} \\ 0 & \text{if } x \text{ is irrational} \end{cases}$$

which is known as

- Dirichlet's function.

\checkmark S.T. that the Dirichlet's function is not continuous at any point of \mathbb{R} .

Sol Let $f(x) = \begin{cases} 1 & \text{if } x \text{ is rational} \\ 0 & \text{if } x \text{ is irrational} \end{cases}$

let $c = \sqrt{2}$ for this
 c is either rational
or irrational number.

If c is a rational
number:

$$\lim_{x \rightarrow c} f(x) = 1.$$

Let (x_n) be sequence
of irrational numbers
that converges to c .

since $f(x_n) = 0 \forall n$

($\because x_n$ is irrational)

$$\therefore \lim_{n \rightarrow \infty} f(x_n) = 0 \neq f(c).$$

$\therefore (f(x_n))$ does not converge to $f(c)$.

$\therefore f(x)$ is not continuous
at the rational number.

If c is an irrational
number:

$$\lim_{x \rightarrow c} f(x) = 0$$

Let (x_n) be a sequence
of rational numbers that
converges to c .

since $f(x_n) = 1 \forall n$

$$\therefore \lim_{n \rightarrow \infty} f(x_n) = 1 \neq f(c)$$

$\therefore (f(x_n))$ does not converge to $f(c)$.

$\therefore f(x)$ is not conti. at the
irrational number c .

2065

\rightarrow prove that the function is defined
everywhere

$$f(x) = \begin{cases} 2x & \text{when } x \text{ is rational} \\ x+3 & \text{when } x \text{ is irrational} \end{cases}$$

is nowhere continuous.

(1) \rightarrow prove that the function f defined by

$$f(x) = \begin{cases} 2x & \text{if } x \text{ is rational} \\ x+3 & \text{if } x \text{ is irrational} \end{cases}$$

is discontinuous everywhere.

\rightarrow Define $g: \mathbb{R} \rightarrow \mathbb{R}$ by

$$g(x) = \begin{cases} 2x & \text{for } x \text{ rational} \\ x+3 & \text{for } x \text{ irrational} \end{cases}$$

Find all points at which g is continuous.

Sol Given that

$$g(x) = \begin{cases} 2x & \text{for } x \text{ rational} \\ x+3 & \text{for } x \text{ irrational} \end{cases}$$

Let x be any real number,
for each $n \in \mathbb{N}$, \exists a rational number r_n and an irrational number i_n such that

$$x - r_n < c_n < x + i_n \text{ and}$$

$$|r_n - x| < \epsilon \text{ and } |i_n - x| < \epsilon$$

$$\Rightarrow |c_n - x| < \epsilon \text{ and } |x + i_n - x| < \epsilon \quad (1)$$

$$\Rightarrow \lim_{n \rightarrow \infty} c_n = x \text{ and } \lim_{n \rightarrow \infty} x + i_n = x \quad \text{by (1)}$$

$$\Rightarrow \lim_{n \rightarrow \infty} c_n = x = \lim_{n \rightarrow \infty} x \quad (1)$$

If g is continuous at x ,
then we must have

$$\lim_{n \rightarrow \infty} g(c_n) = g(x) = \lim_{n \rightarrow \infty} g(x)$$

$$\text{but } g(c_n) = 2c_n \neq x.$$

$$g(c_n) = b_n + 3.$$

$$\therefore \lim_{n \rightarrow \infty} 2c_n = g(x) = \lim_{n \rightarrow \infty} (b_n + 3)$$

$$\Rightarrow 2\lim_{n \rightarrow \infty} c_n = g(x) = \lim_{n \rightarrow \infty} b_n + 3$$

$$\Rightarrow 2x = g(x) = x + 3 \quad (\text{by (1)})$$

$$\Rightarrow x = 3$$

$\therefore 3$ is the only possible point of continuity and discontinuity.
Every other point

now we show $g + f$ is

continuous at $x=3$.

$$g(3) = 6.$$

Let $\epsilon > 0$ be given,

for a rational number ' x ',
we have

$$|g(x) - g(3)| = |2x - 6| \\ = 2|x - 3| \rightarrow (2)$$

for an irrational number ' x ',

$$\text{we have } |x+3 - 6| = |x-3| \rightarrow (3)$$

from ②,

$$|g(x) - g(3)| \leq 2|x-3| < \epsilon$$

whenever $|x-3| < \frac{\epsilon}{2}$

choosing $\delta = \frac{\epsilon}{2}$

$$\therefore |g(x) - g(3)| \leq \epsilon \text{ whenever } |x-3| < \delta$$

from ③,

$$|g(x) - g(3)| \leq 1 \cdot |x-3| < \epsilon$$

whenever $|x-3| < \frac{\epsilon}{1}$

choosing $\delta = \frac{\epsilon}{1}$

$$\therefore |g(x) - g(3)| \leq \epsilon \text{ whenever } |x-3| < \delta$$

$\therefore g(x)$ is continuous at $x=3$.

Q3
2001

Let f be defined on

by setting $f(x) = \begin{cases} x, & \text{if } x \text{ is rational} \\ 1-x, & \text{if } x \text{ is irrational} \end{cases}$

Show that f is continuous

at $x = x_0$ but discontinuous

nowhere at every other point.

Q3
show that the function

f defined by

$$f(x) = \begin{cases} x, & \text{if } x \text{ is rational} \\ 0, & \text{if } x \text{ is irrational} \end{cases}$$

continuous only at

s.t. the function is discontinuous

only at

\Rightarrow \Rightarrow

* examine the continuity of the following functions at the indicated point.

$$(i) f(x) = \begin{cases} e^x - 1, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

$$(ii) f(x) = \begin{cases} \frac{e^x - 1}{1 + e^x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

$$(iii) f(x) = \begin{cases} \frac{e^x - e^{-x}}{e^x + e^{-x}}, & \text{if } x \neq 0 \\ 1, & \text{if } x = 0 \end{cases}$$

$$(iv) f(x) = \begin{cases} (x-a) \frac{e^{-x/a} - 1}{e^{-x/a} + 1}, & \text{if } x \neq a \\ 0, & \text{if } x = a \end{cases}$$

$$(v) f(x) = \begin{cases} \frac{x e^x}{1 + e^x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

Q3

Since $x \rightarrow 0^- \Rightarrow \frac{1}{x} \rightarrow -\infty$

and $x \rightarrow 0^+ \Rightarrow \frac{1}{x} \rightarrow +\infty$

LHL

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{e^{1/x} - 1}{e^{1/x} + 1}$$

$$\Rightarrow \frac{e^{-\infty} - 1}{e^{-\infty} + 1} = \frac{0 - 1}{0 + 1} = -1.$$

RHL

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \frac{e^{1/x} - 1}{e^{1/x} + 1}$$

$$= \lim_{x \rightarrow 0^+} \left[\frac{1-e^{-x}}{1+e^{-x}} \right]$$

$$= \frac{1-e^{\infty}}{1+e^{\infty}}$$

$$= \frac{1-0}{1+0} = 1.$$

$$\lim_{x \rightarrow 0^+} f(x) \neq \lim_{x \rightarrow 0^+} f(x)$$

$\therefore \lim_{x \rightarrow 0^+} f(x)$ does not exist

(iv)

$$\text{Since } x \rightarrow \infty \Rightarrow (e-x) \rightarrow 0^-$$

$$\Rightarrow \frac{1}{e^{x-a}} \rightarrow \infty$$

$$\text{and } x \rightarrow \infty \Rightarrow (e-x) \rightarrow 0^+$$

$$\Rightarrow \frac{1}{e^{x-a}} \rightarrow +\infty.$$

LHL

$$\lim_{x \rightarrow c^-} f(x) = \lim_{x \rightarrow c^-} (x-a) \left[\frac{e^{(x-a)}-1}{e^{(x-a)}+1} \right]$$

$$= 0 \times \left[\frac{e^{\infty}-1}{e^{\infty}+1} \right]$$

$$= 0 \times \left[\frac{0-1}{0+1} \right] = 0 \times (-1)$$

$$= 0.$$

RHL

$$\lim_{x \rightarrow c^+} f(x) = \lim_{x \rightarrow c^+} (x-a) \left[\frac{e^{(x-a)}-1}{e^{(x-a)}+1} \right]$$

$$= \lim_{x \rightarrow c^+} (x-a) \left[\frac{1-e^{-\frac{1}{x-a}}}{1+e^{-\frac{1}{x-a}}} \right]$$

$$= 0 \times \left[\frac{1-e^0}{1+e^0} \right]$$

$$= 0 \times \left[\frac{1-1}{1+1} \right]$$

$$= 0 \times 1 = 0$$

$$\lim_{x \rightarrow a} g,$$

$$f(a) = 0.$$

(16)

$$\therefore (\lim_{x \rightarrow a} f(x) = \lim_{x \rightarrow a} g(x)) \Rightarrow f(a),$$

$$\Rightarrow \lim_{x \rightarrow a} f(x) = f(a).$$

$\therefore f(x)$ is conti at $x=a$

Discuss the continuity
of the following functions at $x=a$

(i) $f(x) = \begin{cases} x^a & \text{if } x \neq 0 \\ -a & \text{if } x=0 \end{cases}$

(ii) $f(x) = \begin{cases} \sin \frac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases}$

(iii) $f(x) = \begin{cases} x \sin \frac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases}$

(iv) $f(x) = \begin{cases} x^2 \sin \frac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases}$

(v) $f(x) = \begin{cases} \cos \frac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases}$

(vi) $f(x) = \begin{cases} x \cos \frac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases}$

(vii) $f(x) = \begin{cases} x^2 \cos \frac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases}$

(viii) $f(x) = \begin{cases} \log x & \text{if } x > 0 \\ \omega x & \text{if } x < 0 \end{cases}$

SOL (i) Since $x \rightarrow 0^+$
 $\Rightarrow \frac{1}{x} \rightarrow +\infty$
 $x \rightarrow 0^-$
 $\Rightarrow \frac{1}{x} \rightarrow -\infty$

LHL
 $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^-} \frac{1}{x}$
 $= \infty$
 $= \frac{1}{0^+} = \frac{1}{0^-} = 0$

RHL
 $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \frac{1}{x}$
 $= 2^\infty = \infty$
 $\therefore \lim_{x \rightarrow 0^+} f(x)$ does not exist
 $\therefore f$ is discontinuous at $x=0$

(ii) Since $x \rightarrow 0^+ \Rightarrow \frac{1}{x} \rightarrow +\infty$
 $x \rightarrow 0^- \Rightarrow \frac{1}{x} \rightarrow -\infty$

LHL
 $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{1}{x}$
 $= l (\because -1 \leq l \leq 1)$

Since l is finite number
 but it is not fixed number
 because l rotates w.r.t -1 to 1
 $\therefore \lim_{x \rightarrow 0^-} f(x)$ does not exist

∴ RHL does not exist
 $\therefore f$ is discontinuous at $x=0$

(iii) Since $x \rightarrow 0^+ \Rightarrow \frac{1}{x} \rightarrow \infty$
 $x \rightarrow 0^- \Rightarrow \frac{1}{x} \rightarrow -\infty$

LHL
 $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^-} \frac{1}{x}$
 $= 0 \times 2 (\because -1 \leq l \leq 1)$
 $= 0$

RHL
 $\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \frac{1}{x}$
 $= 0 \times l (\because -1 \leq l \leq 1)$
 $= 0$
 at $x=0$
 $f(0) = 0$
 $\therefore [\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^-} f(x)] = f(0)$
 $\Rightarrow \lim_{x \rightarrow 0} f(x) = f(0)$
 $\therefore f$ is continuous at $x=0$

(v) Since $x \rightarrow 0 \Rightarrow \frac{1}{x} \rightarrow \infty$
 $x \rightarrow 0^+ \Rightarrow \frac{1}{x} \rightarrow +\infty$

LHL
 $\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{1}{x}$
 $= l$

Since l is finite number
 but it is not fixed
 because l rotates w.r.t
 -1 to 1
 $\therefore \lim_{x \rightarrow 0^-} f(x)$ does not exist

∴ RHL does not exist
 $\therefore f$ is not continuous
 $\Rightarrow x=0$

discusses the continuity
of the following function
at $x=a$.

$$\text{(i) } f(x) = \begin{cases} (x-a) \sin\left(\frac{1}{x-a}\right) & \text{if } x \neq a \\ 0 & \text{if } x=a \end{cases}$$

$$\text{(ii) } f(x) = \begin{cases} (x-a) \cos\left(\frac{1}{x-a}\right) & \text{if } x \neq a \\ 0 & \text{if } x=a \end{cases}$$

$$\text{(iii) } f(x) = \begin{cases} \frac{1}{x-a} \cosec(x-a) & \text{if } x \neq a \\ 0 & \text{if } x=a \end{cases}$$

Examine the discontinuity of the following functions at the indicated point.

$$\text{(i) } f(x) = \begin{cases} \frac{|x|}{x}, \text{ when } x \neq 0 \\ 1 \text{ when } x=0 \end{cases}$$

$$\text{(ii) } f(x) = |x| + |x-1| \text{ at } x=0 \text{ and } x=1.$$

$$\text{(iii) } f(x) = \begin{cases} \frac{x-1}{x}, \text{ if } x \neq 0 \\ 1 \text{ if } x=0 \end{cases}$$

$$\text{(iv) } f(x) = \begin{cases} \frac{|x-1|}{x-2} & \text{if } x \neq 2 \\ -1 & \text{if } x=2 \end{cases} \text{ at } x=2$$

$$\text{(v) } f(x) = \begin{cases} \frac{x}{|x|+x} & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases} \text{ at } x=0$$

$$\text{(vi) } f(x) = \begin{cases} \frac{|x|}{x+2x} & \text{if } x \neq 0 \\ 0 & \text{if } x=0 \end{cases} \text{ at } x=0$$

$\therefore \underset{x \rightarrow 2}{\text{Lt}} f(x)$ does not exist

$\therefore f$ is not conti. at $x=2$

QED

Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be

such that

$$f(x) = \begin{cases} \sin(\cot x) + \tan x, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases}$$

otherwise the value is not defined

$$\underline{\text{RHL}} \quad \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} f(0) = 0.$$

$$\therefore \text{LHL} = \text{RHL} = f(0)$$

$\therefore f$ is continuous at '0'.

$$\underline{\text{LHD}}: \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0^-} \frac{-x - 0}{x}$$

$$= -1$$

$$\underline{\text{RHD}}: \lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0^+} \frac{x - 0}{x}$$

$$= +1$$

$\therefore \text{LHD} \neq \text{RHD}$

$\therefore f$ is not differentiable at '0'.

Note(2): If f is not continuous at any point, it can not be derivable at that point.

Note(3): Let $I \subseteq \mathbb{R}$ be an interval, let $c \in I$ and let $f: I \rightarrow \mathbb{R}$ and $g: I \rightarrow \mathbb{R}$ be functions that are differentiable at 'c'. Then

(i) If $x \in \mathbb{R}$ then the function xf is differentiable at 'c' and $(xf)'(c) = xf'(c)$

(ii) The function $f+g$ is differentiable at 'c' and $(f+g)'(c) = f'(c) + g'(c)$

(iii) The function fg is differentiable at 'c' and

$$(fg)'(c) = f(c)g'(c) + f'(c)g(c).$$

④ If $g(c) \neq 0$ then the function f/g is differentiable at 'c' and $(f/g)'(c) = \frac{f'(c)g(c) - g'(c)f(c)}{(g(c))^2}$

Problems:

→ use the definition to find the derivative of each of the following functions.

(i) $f(x) = x^3$ & $x \in \mathbb{R}$

(ii) $g(x) = \frac{1}{x}$ & $x \in \mathbb{R}, x \neq 0$.

(iii) $h(x) = \sqrt{x}$ & $x > 0$.

(iv) $k(x) = \frac{1}{\sqrt{x}}$ for $x > 0$.

Sol'n (i) Let $x = c > 0$

$$\text{then } h(c) = \sqrt{c}$$

$$\text{Now } h'(c) = \lim_{x \rightarrow c} \frac{h(x) - h(c)}{x - c}$$

$$= \lim_{x \rightarrow c} \frac{\sqrt{x} - \sqrt{c}}{x - c}$$

$$= \lim_{x \rightarrow c} \left(\frac{\sqrt{x} - \sqrt{c}}{x - c} \right) \times \left(\frac{\sqrt{x} + \sqrt{c}}{\sqrt{x} + \sqrt{c}} \right)$$

$$= \lim_{x \rightarrow c} \frac{(x - c)}{(x - c)(\sqrt{x} + \sqrt{c})}$$

$$= \lim_{x \rightarrow c} \frac{1}{\sqrt{x} + \sqrt{c}}$$

$$= \frac{1}{\sqrt{c} + \sqrt{c}} = \frac{1}{2\sqrt{c}} \text{ exists.}$$

$\therefore f$ is defined for all +ve values of \mathbb{R} and $f'(x) = \frac{1}{2\sqrt{x}}$

\Rightarrow show that $f(x) = \sqrt[3]{x}$; $x \in \mathbb{R}$ is not differentiable at $x=0$.

Sol'n: at $x=0$; $f(0)=0$

$$\text{Now } f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x-0}$$

$$= \lim_{x \rightarrow 0} \frac{\sqrt[3]{x} - 0}{x}$$

$$= \lim_{x \rightarrow 0} \left(\frac{1}{x}\right)^{1/3} \text{ does not exist.}$$

$\therefore f$ is not differentiable at $x=0$.

\Rightarrow Let $f: \mathbb{R} \rightarrow \mathbb{R}$ be defined

by

$$f(x) = \begin{cases} x^2 & \text{for } x \text{ rational} \\ 0 & \text{for } x \text{ irrational.} \end{cases}$$

Show that f is differentiable at $x=0$ and find $f'(0)$.

Sol'n: Let $f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x-0}$

$$= L \quad \text{--- (1)}$$

(i) when x is rational number

then $f'(0) = \lim_{x \rightarrow 0} \frac{x^2 - 0}{x-0}$

$$= \lim_{x \rightarrow 0} \frac{x^2}{x}$$

$$= \lim_{x \rightarrow 0} x = 0$$

(ii) when x is irrational number

then $f'(0) = \lim_{x \rightarrow 0} \frac{0 - 0}{x-0}$

$$= \lim_{x \rightarrow 0} 0 = 0$$

$$\therefore f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x-0} = 0$$

Now, we have

$$\left| \frac{f(x) - f(0)}{x-0} - L \right| = \left| \frac{f(x) - f(0)}{x-0} - 0 \right|$$

$$= \left| \frac{x^2 - 0}{x} - 0 \right|$$

($\because x$ is rational)

$$= |x| < \epsilon \text{ whenever } |x| < \frac{\epsilon}{1}$$

choosing $\delta = \frac{\epsilon}{1}$

$$\left| \frac{f(x) - f(0)}{x-0} - L \right| < \epsilon \text{ whenever } 0 < |x-0| < \delta \quad @$$

Now we have

$$\left| \frac{f(x) - f(0)}{x-0} - L \right| = \left| \frac{f(x) - f(0)}{x-0} - 0 \right|$$

$$= \left| \frac{0 - 0}{x-0} - 0 \right|$$

$\therefore x$ is irrational

$$= 0 < \epsilon \text{ whenever } 0 < |x-0| < \delta$$

$$\left| \frac{f(x) - f(0)}{x-0} - L \right| < \epsilon \text{ whenever } 0 < |x-0| < \delta$$

$\therefore f$ is differentiable at $x=0$.

and $f'(0) = 0$.

P-I 2006 Find a & b so that $f'(0)$ exists

where

$$f(x) = \begin{cases} \frac{1}{|x|} & \text{if } |x| > 2 \\ a + bx^2 & \text{if } |x| \leq 2 \end{cases}$$

∴ continuity one function is continuous
at $x=0$.

Soln: at $x=0$

$$f(0) = c$$

LHL

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{\sin((c+1)x) + \sin x}{x}$$

$$= \lim_{x \rightarrow 0^-} \left[\frac{\sin((c+1)x)}{x} + \frac{\sin x}{x} \right]$$

$$= \lim_{x \rightarrow 0^-} \left[(c+1) \frac{\sin((c+1)x)}{(c+1)x} + \lim_{x \rightarrow 0^-} \frac{\sin x}{x} \right]$$

$$= (c+1) \lim_{x \rightarrow 0^-} \frac{\sin((c+1)x)}{(c+1)x} + \lim_{x \rightarrow 0^-} \frac{\sin x}{x}$$

$$(\because x \rightarrow 0^- \\ \Rightarrow c+1 \neq 0)$$

$$= (c+1)(1) + 0 \quad (\because \lim_{x \rightarrow 0^-} \frac{\sin x}{x} = 1)$$

$$= c+2$$

—

RHL

$$\lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \frac{(x+bx)^{\frac{1}{x}} - 1}{bx^{\frac{1}{x}}}$$

$$= \lim_{x \rightarrow 0^+} \frac{x^{\frac{1}{x}} - (1+bx)^{\frac{1}{x}}}{bx^{\frac{1}{x}}}$$

$$= \lim_{x \rightarrow 0^+} \frac{(1+bx)^{\frac{1}{x}} - 1}{bx}$$

$$= \lim_{x \rightarrow 0^+} \frac{\sqrt{1+bx} - 1}{bx} \times \frac{\sqrt{1+bx} + 1}{\sqrt{1+bx} + 1}$$

$$= \lim_{x \rightarrow 0^+} \frac{\sqrt{1+bx} - 1}{bx(\sqrt{1+bx} + 1)}$$

$$= \frac{1}{\sqrt{1+b(0)} + 1} \quad (\because b \neq 0)$$

$$= \frac{1}{2} \quad \text{THIS IS THE R.H.L}$$

so that b can have any non-zero real value. (18)

Since f is conti at $x=0$,

we have,

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^+} f(x) = f(0)$$

$$\Rightarrow a+2 = c$$

$$\Rightarrow a+2 = c \quad (c \neq a)$$

$$\therefore Lf(x) = Lt_{x \rightarrow c^+} f(x) = f(c)$$

$\therefore f(x)$ is continuous at
 $x \neq \pm \frac{1}{2}, \pm \frac{1}{3}, \dots$

Ex Show that the absolute function $f(x) = |x|$ is continuous at every point $c \in \mathbb{R}$

Sol Given that $f(x) = |x|$ when
 $x \in \mathbb{R}$ for then let

Now we will show that $Lf(x) = f(c)$ (2)

$$Lf(x) = f(c)$$

$$\text{i.e. } Lf(x) \rightarrow f(c) \text{ as } x \rightarrow c.$$

Let $\epsilon > 0$ be given. Now we have

$$|f(x) - f(c)| = ||x| - |c||$$

$$\leq |x - c|$$

$$\leq \epsilon \text{ whenever } |x - c| < \frac{\epsilon}{1}$$

choosing $\delta = \frac{\epsilon}{1}$.

$\therefore |f(x) - f(c)| < \epsilon$ whenever $|x - c| < \delta$.

i.e. $Lf(x) \rightarrow f(c)$ as $x \rightarrow c$.

$$Lf(x) = f(c).$$

$\therefore f(x)$ is continuous at $x = c$

Q Let $K > 0$ and let $f: \mathbb{R} \rightarrow \mathbb{R}$

satisfy the condition

$$|f(x) - f(y)| \leq K|x - y| \forall x, y \in \mathbb{R}$$

Show that f is continuous

at every point $c \in \mathbb{R}$.

Q $K > 0, f: \mathbb{R} \rightarrow \mathbb{R}$

satisfies the condition

$$|f(x) - f(y)| \leq K|x - y| \quad \forall x, y \in \mathbb{R}$$

\therefore Now we shall show that

$$Lf(x) = f(c).$$

$\therefore Lf(x) \rightarrow f(c)$ as $x \rightarrow c$.

for this we are enough to show that,

given any $\epsilon > 0$ (however small),

exists $\delta > 0$ (depends on ϵ) s.t

$$|f(x) - f(c)| < \epsilon \text{ whenever } |x - c| < \delta$$

Now from ①,

we have

$$|f(x) - f(y)| \leq k|x-y|$$

$\forall x, y \in (c-\delta, c+\delta)$

Taking $x=c$, $y=c$, we get

$$|f(c) - f(c)| \leq k|c-c|$$

\Leftrightarrow whenever

$$|c-c| < \frac{\epsilon}{k}$$

Choosing $\delta = \frac{\epsilon}{k}$

$$\therefore |f(c) - f(c)| < \epsilon \text{ whenever } |c-c| < \delta$$

i.e. $f(c) = f(c)$ as $c \neq c$

$$\therefore L^+(f)(c) = f(c)$$

$\therefore f(c)$ is continuous at $c = c$.

Let g be defined on \mathbb{R}

$$\text{by } g(x) = \begin{cases} 0 & \text{for } x=1 \\ 2 & \text{for } x \neq 1 \end{cases}$$

and let $f(x) = x+1 \forall x \in \mathbb{R}$. if $f(x+y) = f(x) + f(y)$ for all $x, y \in \mathbb{R}$

$$\text{Show that } L^+(g \circ f)(x) \neq (g \circ f)(0)$$

$$\text{sol} \quad g(x) = \begin{cases} 2 & \text{for } x \neq 1 \\ 0 & \text{for } x=1 \end{cases}$$

and $f(x) = x+1 \forall x \in \mathbb{R}$.

$$\text{Now } f(x) = x+1 \forall x \in \mathbb{R}$$

$$\text{Now } (g \circ f)(x) = g(f(x))$$

$$= g(x+1)$$

$$= \begin{cases} 2 & \text{for } x+1 \neq 1 \\ 0 & \text{for } x+1=1 \end{cases}$$

$$= \begin{cases} 2 & \text{for } x \neq 0 \\ 0 & \text{for } x=0 \end{cases}$$

$$= \begin{cases} 2 & \text{for } x \neq 0 \\ 0 & \text{for } x=0 \end{cases}$$

$$\text{Now } L^+(g \circ f)(0) \stackrel{x \rightarrow 0^-}{=} L^+(2) \stackrel{x \rightarrow 0^+}{=} 2$$

and

$$L^+(g \circ f)(0) \stackrel{x \rightarrow 0^+}{=} 2$$

$\neq 2$

$$\therefore (L^+(g \circ f))(0) \stackrel{x \rightarrow 0^-}{=} L^+(g \circ f) \stackrel{x \rightarrow 0^+}{=} 2$$

$$\Rightarrow L^+(g \circ f)(0) = 2$$

But $x=0$,

$$(g \circ f)(0) = 0$$

from ① & ②

$$L^+(g \circ f)(0) \neq (g \circ f)(0)$$

def: A function $f: \mathbb{R} \rightarrow \mathbb{R}$

is said to be additive

if $f(x+y) = f(x) + f(y)$ for all $x, y \in \mathbb{R}$

prove that if f is continuous at some x_0 , then it is continuous at every point of \mathbb{R} .

sol continuity at the point no.:

$$L^+(f(x)) = L^+ f(x_0+h) \quad \begin{array}{l} \text{putting} \\ x=x_0+h, h \rightarrow 0 \end{array}$$

$$= L^+ [f(x_0) + f(h)] \quad \begin{array}{l} \because f(x+y) = \\ f(x)+f(y) \end{array}$$

$$= L^+ f(x_0) + L^+ f(h)$$

$$= f(x_0) + L^+ f(h)$$

$$\text{Sly } L^+ f(x) = L^+ f(x_0+h)$$

$$\begin{array}{l} \xrightarrow{x \rightarrow x_0^+} \xrightarrow{h \rightarrow 0} \\ \text{putting} \\ x = x_0 + h \\ \xrightarrow{h > 0} \end{array}$$

$$= L^+ [f(x_0) + f(h)]$$

$$\begin{array}{l} \xrightarrow{h \rightarrow 0} \\ \therefore f(x+h) = \\ f(x) + f(h) \end{array}$$

$$= L^+ f(x_0) + L^+ f(h)$$

$$\xrightarrow{h \rightarrow 0}$$

$$= f(x_0) + f(h)$$

$$\boxed{L^+ f(x) = f(x_0) + f(h)}$$

$$\xrightarrow{x \rightarrow x_0^+}$$

Since f is continuous at $x = x_0$

$$\therefore L^+ f(x) = L^+ f(x) = f(x_0)$$

$$\xrightarrow{x \rightarrow x_0^-} \xrightarrow{x \rightarrow x_0^+}$$

$$\Rightarrow f(x_0) + L^+ f(-h) = f(x_0) +$$

$$- L^+ f(h) = f(x_0)$$

$$\therefore L^+ f(-h) = L^+ f(h) = 0$$

$$\xrightarrow{h \rightarrow 0}$$

$$\Rightarrow L^+ f(-h) = L^+ f(h) = 0$$

$$\xrightarrow{h \rightarrow 0}$$

$$\Rightarrow \boxed{L^+ f(x) = f(x_0)}$$

Let c be any real number

then $L^+ f(x) \underset{x \rightarrow c^-}{=} \lim_{h \rightarrow 0} f(c-h)$ [putting $x = c-h$]

$$= L^+ (f(c) + f(-h))$$

$$\xrightarrow{h \rightarrow 0}$$

$$\because f(x+h) = \\ f(x) + f(h)$$

$$= L^+ f(c) + L^+ f(-h)$$

$$\xrightarrow{h \rightarrow 0}$$

$$= f(c) + 0 \quad (\text{from } ①)$$

$$\boxed{L^+ f(x) = f(c)}$$

$$\xrightarrow{x \rightarrow c^-}$$

$$\text{Also } L^+ f(x) = L^+ f(c+h)$$

$$\xrightarrow{h \rightarrow 0}$$

$$\begin{array}{l} \text{putting} \\ x = c + h \\ \xrightarrow{h > 0} \end{array}$$

$$= L^+ [f(c) + f(h)]$$

$$\xrightarrow{h \rightarrow 0}$$

$$= L^+ f(c) + L^+ f(h)$$

$$\xrightarrow{h \rightarrow 0}$$

$$= f(c) + 0 \quad (\text{from } ②)$$

$$\boxed{L^+ f(x) = f(c)}$$

$$\xrightarrow{x \rightarrow c^+}$$

$$\therefore L^+ f(x) = L^+ f(x) = f(c)$$

$$\xrightarrow{x \rightarrow c^+}$$

$\therefore f(x)$ is continuous at $x = c$

Given If f a function of x is continuous at $x = c$ then $|f|$ is also continuous at $x = c$.

Proof Since f is continuous at $x = c$

$$\therefore |f(x)| \leq \text{ whenever } |x-c| < \delta$$

$$|f(x) - f(c)| < \epsilon \text{ whenever } |x-c| < \delta$$

Now we have

$$|f(x) - f(c)| \leq |f(x)| < \epsilon$$

whenever $|x-c| < \delta$

$$(\text{from } ①)$$

$$|f(x) - f(c)| \geq \epsilon \text{ whenever } |x-c| < \delta$$

$\therefore |f|$ is continuous at c

Note:- The converse of the above theorem need not be true.

i.e. if $|f|$ is continuous at c then f need not

For example

$$f(x) = \begin{cases} 1 & \text{if } x \geq 0 \\ -1 & \text{if } x < 0 \end{cases}$$

so

$$\lim_{x \rightarrow 0} |f(x)| = \lim_{x \rightarrow 0} |f(0)| = 1, \forall x \in \mathbb{R}.$$

$$\lim_{x \rightarrow 0^+} |f(x)| = \lim_{x \rightarrow 0^+} |f(0)| = 1$$

at $x=0$,

$$|f(0)| = |f(0)|$$

$$= 1$$

$$\lim_{x \rightarrow 0^-} |f(x)| = \lim_{x \rightarrow 0^-} |f(0)|.$$

$|f|$ is continuous at $x=0$

\dots

$$\begin{matrix} \text{Now} \\ f + f(x) \xrightarrow{x \rightarrow 0^-} f(0) = 1 \end{matrix}$$

$$\begin{matrix} \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} f(0) = 1 \\ \text{at } x=0^+ \end{matrix}$$

$$\therefore \lim_{x \rightarrow 0^+} f(x) \neq \lim_{x \rightarrow 0^-} f(x)$$

$\therefore f(x)$ is not continuous at $x=0$.

Theory \Rightarrow Let $f, g: \mathbb{R} \rightarrow \mathbb{R}$

i) continuous at 'c' and

$$\text{let } h(x) = \max\{f(x), g(x)\}$$

i.e., $\sup\{f(x), g(x)\}$ for $x \neq c$

$$\text{Show } \lim_{x \rightarrow c} h(x) = \frac{1}{2}(f(c) + g(c)) + \frac{1}{2}|f(c) - g(c)|$$

Use this to show that h is continuous at 'c'.

Proof: Since $f: \mathbb{R} \rightarrow \mathbb{R}$ & $g: \mathbb{R} \rightarrow \mathbb{R}$ are two continuous functions at 'c'

$$\lim_{x \rightarrow c} f(x) = f(c) \quad \text{&}$$

$$\lim_{x \rightarrow c} g(x) = g(c)$$

∴ since

$$h(x) = \sup\{f(x), g(x)\}, \forall x \in \mathbb{R}$$

$$\text{i.e., } h(x) = \min\{f(x), g(x)\}, \forall x \in \mathbb{R}$$

$$\textcircled{1} \quad h(x) = \begin{cases} f(x), & \text{if } f(x) \geq g(x) \\ g(x), & \text{if } f(x) \leq g(x) \end{cases}$$

Now since, $\forall x \in \mathbb{R}$,

$$\frac{1}{2}(f(x) + g(x)) + \frac{1}{2}|f(x) - g(x)|$$

$$= \begin{cases} \frac{1}{2}(f(x) + g(x)) + \frac{1}{2}[f(x) - g(x)], & \text{if } f(x) \geq g(x) \\ \frac{1}{2}(f(x) + g(x)) + \frac{1}{2}[-(f(x) - g(x))], & \text{if } f(x) \leq g(x) \end{cases}$$

$$= \begin{cases} f(x), & \text{if } f(x) \geq g(x) \\ g(x), & \text{if } f(x) \leq g(x). \end{cases}$$

$$= h(x) \quad (\text{by } \textcircled{1})$$

\Rightarrow

(ii) To show h is continuous at 'c'

since f, g are continuous at 'c'

$\therefore f+g$ is also continuous at 'c'

$\Rightarrow \frac{1}{2}(f+g)$ is also continuous at 'c'

$\therefore \frac{1}{2}(f-g)$ is continuous at 'c'

$\Rightarrow |f-g|$ is also continuous at 'c'

$\Rightarrow \frac{1}{2}|f-g|$ is also continuous at 'c'

from (C) & (D)

$\frac{1}{2}(f+g) + \frac{1}{2}|f-g|$ is also continuous at 'c'.

$$\therefore h(x) = \frac{1}{2}(f(x) + g(x)) + \frac{1}{2}|f(x) - g(x)|$$

continuous at $x=c$.

$$\begin{aligned} \lim_{x \rightarrow c} h(x) &= \lim_{x \rightarrow c} \frac{1}{2}[f(x) + g(x)] + \frac{1}{2}|f(x) - g(x)| \\ &= \frac{1}{2}\left[\lim_{x \rightarrow c} f(x) + \lim_{x \rightarrow c} g(x)\right] + \frac{1}{2}\left[\lim_{x \rightarrow c} |f(x) - g(x)|\right] \\ &= \frac{1}{2}[f(c) + g(c)] + \frac{1}{2}|f(c) - g(c)| \\ &= h(c) \end{aligned}$$

by (D)

$$\therefore \lim_{x \rightarrow c} h(x) = h(c).$$

$\therefore h(x)$ is continuous at 'c'.

H.W Let $f, g: \mathbb{R} \rightarrow \mathbb{R}$ be continuous at 'c' and let

$$h(x) = \inf\{f(x), g(x)\}$$

$$\text{i.e., } h(x) = \min\{f(x), g(x)\} \text{ for } x \in \mathbb{R}$$

$$\text{Show that } h(x) = \frac{1}{2}(f(x) + g(x)) - \frac{1}{2}|f(x) - g(x)| \quad \forall x \in \mathbb{R}$$

Use this to show that h is continuous at 'c'.

Theorem A function f is continuous at 'c' iff for each $\epsilon > 0$, \exists a $\delta > 0$ such that $|f(x_1) - f(x_2)| < \epsilon$ whenever $x_1, x_2 \in (c-\delta, c+\delta)$.

Proof: (i) Let f be a continuous function at 'c'.

then for each $\epsilon > 0$, \exists a $\delta > 0$ such that

$$|f(x) - f(c)| < \frac{\epsilon}{2} \text{ whenever } |x - c| < \delta.$$

$$\Rightarrow |f(x) - f(c)| < \frac{\epsilon}{2} \text{ whenever } -\delta < x - c < \delta.$$

$$\Rightarrow |f(x) - f(c)| < \frac{\epsilon}{2} \text{ whenever } c - \delta < x < c + \delta.$$

$$\Rightarrow |f(x) - f(c)| < \frac{\epsilon}{2} \text{ whenever } x \in (c-\delta, c+\delta)$$

Now for $x_1, x_2 \in (c-\delta, c+\delta)$

$$|f(x_1) - f(x_2)| < \frac{\epsilon}{2} \text{ & } |f(x_2) - f(c)| < \frac{\epsilon}{2} \quad (1)$$

Now we have

$$\begin{aligned}|f(x_1) - f(x_2)| &= |f(x_1) - f(c) + f(c) - f(x_2)| \\&\leq |f(x_1) - f(c)| + |f(x_2) - f(c)| \\&< \epsilon_1 + \epsilon_2 = \epsilon \quad (\text{by } (1))\end{aligned}$$

$\therefore |f(x_1) - f(x_2)| < \epsilon \text{ whenever } x_1, x_2 \in (c-\delta, c+\delta)$

(ii) Conversely Suppose that for each $\epsilon > 0, \exists$
a $\delta > 0$ such that $|f(x_1) - f(x_2)| < \epsilon$
whenever $x_1, x_2 \in (c-\delta, c+\delta)$.

Taking $x_1 = x$ & $x_2 = c$

we have $|f(x) - f(c)| < \epsilon$ whenever

$$x \in (c-\delta, c+\delta)$$

$\therefore f$ is continuous at $x=c$

Theorem If a function f is continuous at 'c' then
it is bounded in some nbd of 'c'.

Proof: Since f is continuous at 'c'

Given $\epsilon > 0, \exists \delta > 0$ such that
 $|f(x) - f(c)| < \epsilon$ whenever $|x-c| < \delta, x \in D_f$

$$\Rightarrow f(c) - \epsilon < f(x) < f(c) + \epsilon \quad \text{whenever } (c-\delta, c+\delta) \cap D_f$$

$$\text{Let } M = \max \{ |f(c) - \epsilon|, |f(c) + \epsilon| \}$$

then $-M \leq f(x) \leq M$ whenever $x \in (c-\delta, c+\delta) \cap D_f$

$$\Rightarrow |f(x)| \leq M \text{ whenever } x \in (c-\delta, c+\delta) \cap D_f$$

$\therefore f$ is bounded in some nbd of 'c'.

Ex: $f(x) = \sin x$ is continuous for all $x \in \mathbb{R}$
and the range of $\sin x$ is $[-1, 1]$
 $\therefore -1 \leq \sin x \leq 1 \quad \forall x \in \mathbb{R}$
 $\inf = -1 \text{ & } \sup = 1$
 $\therefore f$ is bdd. (for each nbd of x)

258
324

If f is a continuous function of x satisfying
the functional equation

[2x3]

$$f(x+y) = f(x) + f(y)$$

Show that $f(x) = ax$, where ' a ' is a constant.

$\forall x \in \mathbb{R}$.

Sol:

Given that 'f' is continuous
and $f(x+y) = f(x) + f(y)$ —①

Taking $x = 0 = y$ in ①

$$\text{②} \Rightarrow f(0+0) = f(0) + f(0)$$

$$\Rightarrow f(0) = f(0) + f(0)$$

$$\Rightarrow f(0) \neq 0 = f(0) + f(0)$$

$$\Rightarrow f(0) = 0$$

Taking $y = -x$.

$$\text{③} \Rightarrow f(x+(-x)) = f(x) + f(-x)$$

$$\Rightarrow f(0) = f(x) + f(-x)$$

$$\Rightarrow -\text{②} = f(x) + f(-x)$$

$$\Rightarrow f(-x) = -f(x)$$

If x be a +ve integer,

we have

$$f(x) = f(1+1+1+\dots+1)$$

$$= f(1) + f(1) + f(1) + \dots + f(1)$$

$$= x f(1)$$

$$= ax, \text{ say}$$

where $f(1) = a$.

Let now let x be a -ve integer.

We write $x = -y$ so that y is the integer.

we have

$$\begin{aligned} f(x) &= f(-y) \\ &= -f(y) \quad [\because f(-y) = -f(y)] \\ &= -ay \\ &= a(-y) \\ &= ax. \end{aligned}$$

Again, let $x = \frac{p}{q}$ be a rational number;
 q being +ve.

we have

$$\begin{aligned} f(p) &= f\left(\frac{p}{q} \cdot q\right) \\ &= f\left(\frac{p}{q} + \frac{p}{q} + \dots \text{ } q \text{ times}\right) \\ &= f\left(\frac{p}{q}\right) + f\left(\frac{p}{q}\right) + \dots \text{ } q \text{ times} \\ &= q \cdot f\left(\frac{p}{q}\right). \end{aligned}$$

$$\therefore f(p) = q \cdot f\left(\frac{p}{q}\right)$$

$$\Rightarrow ap = q \cdot f\left(\frac{p}{q}\right) \quad (\because f(p) = ap)$$

$$\Rightarrow f\left(\frac{p}{q}\right) = a \cdot \frac{p}{q}$$

$$\Rightarrow f(x) = ax. \quad (\because \frac{p}{q} = x)$$

Now,

Suppose that x is any real number.

Let $\{x_n\}$ be a sequence of rational numbers such
 - that $\lim x_n = x$.

We have, x_n , being rational.

$$f(x_n) = ax_n \quad \text{--- (2)}$$

Let $n \rightarrow \infty$.

- As f is a continuous function.

We obtain from (2)

$$f(x) = ax \forall x.$$

Hence the result

(23)

Partition of a closed interval :-

Let $[a, b]$ be a closed

interval.

If $a = x_0 < x_1 < x_2 < \dots < x_n = b$

x_0, x_1, \dots, x_n

are called

the partition points.

$P = \{x_0, x_1, x_2, \dots, x_{n-1}, x_n\}$ is

called a partition of $[a, b]$.

The $(n+1)$ points x_0, x_1, \dots, x_n

are called partition points

of the set P .

The closed intervals $[x_0, x_1]$,

$[x_1, x_2]$, ..., $[x_{n-1}, x_n]$, ..., $[x_n, b]$

are called the n subintervals

of the closed interval $[a, b]$.

The r^{th} subinterval $[x_{r-1}, x_r]$

is denoted by s_r and its

length $x_r - x_{r-1}$

is denoted by δ_r .

i.e. $s_r = x_r - x_{r-1}$.

\Rightarrow If f is contⁿ on $[a, b]$

then given $\epsilon > 0$ (however small),

the closed interval $[a, b]$ can

be divided into a finite

number of subintervals say,

each of which the oscillation

of f is less than ϵ

i.e. $|f(x_1) - f(x_2)| < \epsilon$ for

any two points x_1 & x_2

in the same subinterval.

if f is continuous
in $[a, b]$ then f is odd
for that interval.

proof since f is continuous
in $[a, b]$

\therefore Given $\epsilon > 0$ (arbitrary),
 $[a, b]$ can be divided into
finite number of subintervals
in each of which the
oscillation of f is less than
 ϵ .

i.e.
let $[a = a_0, a_1], [a_1, a_2], \dots$
 $[a_{n-1}, a_n]$

$$\text{S.T } |f(x_1) - f(x_2)| < \epsilon. \quad \textcircled{1}$$

for any two points x_1, x_2
belonging to the
same subinterval.

Let x be any point in the
first subinterval $[a, a_1]$ then

by ①,

$$|f(x) - f(x_1)| < \epsilon$$

$$\therefore |f(x)| = |f(x_1) - f(x) + f(x)| \\ \leq |f(x_1) - f(x)| + |f(x)| \\ < \epsilon + |f(x)|.$$

In particular $x = a_1$

$$|f(a_1)| < \epsilon + |f(x_1)|. \quad \textcircled{2}$$

Let $x \in [a_1, a_2]$ then by ①

$$|f(x) - f(x_1)| < \epsilon$$

$$\therefore |f(x)| = |f(x) - f(x_1) + f(x_1)| \\ \leq |f(x) - f(x_1)| + |f(x_1)| \\ \therefore |f(x_1)| < \epsilon$$

$$= 2\epsilon + |f(x_1)|^2$$

$$\therefore |f(x)| < 2\epsilon + |f(x_1)|.$$

In particular $x = a_2$,

$$|f(x_2)| < 2\epsilon + |f(x_1)|. \quad \textcircled{3}$$

proceeding,

similarly, we have

$$|f(x)| < n\epsilon + |f(x_n)|$$

This inequality is
satisfied over the whole
interval $[a, b]$.

$\therefore f$ is odd on $[a, b]$.

Note!— The converse of the
above theorem need not be

true
i.e. If f is odd on $[a, b]$
the f need not be continuous
on $[a, b]$.

$$\text{Ex:-} \\ f(x) = \begin{cases} \sin \frac{1}{x}, & \text{if } x \neq 0 \\ 0, & \text{if } x = 0 \end{cases} \quad \forall x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right].$$

$$\text{Sol. } f(x) = \sin \frac{1}{x}$$

$$\Rightarrow f\left(\frac{\pi}{2}\right) = \sin\left(\frac{2}{\pi}\right) = 1$$

$$\& f\left(-\frac{\pi}{2}\right) = \sin\left(\frac{2}{\pi}\right) = 1.$$

$$\therefore -1 \leq f(x) \leq 1 \quad \forall x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right];$$

$$\therefore f \text{ is odd on } \left[-\frac{\pi}{2}, \frac{\pi}{2}\right].$$

but is not continuous at $x=0$.

Because:

$$\text{at } x=0; f(0)=0.$$

Now since $-1 \leq \sin \frac{1}{x} \leq 1$

$$g(x) \leq f(x) \leq h(x)$$

where

$$g(x) = -1, \text{ for all } x \neq 0$$

$$h(x) = 1$$

$$\text{with } \lim_{x \rightarrow 0} g(x) \neq \lim_{x \rightarrow 0} h(x)$$

... by squeeze theorem

$\lim_{x \rightarrow 0} f(x)$ does not exist.

$\therefore f(x)$ is not conti. at $x=0$

$\therefore f(x)$ is not continuous on $[-\frac{\pi}{2}, \frac{\pi}{2}]$

Note:- If f is continuous on (a,b) then f need not

be odd on that interval.

$$\text{Ex:- } f(x) = \ln x, x \in (0,1).$$

since f is continuous on $(0,1)$

but is not odd on $(0,1)$.

Because: $\because x > 0$

$$\Rightarrow \frac{1}{x} > 0$$

$$\Rightarrow 0 < \frac{1}{x} < \infty$$

$$\forall x \in (0,1)$$

$$\Rightarrow 0 < f(\frac{1}{x}) < \ln(1)$$

$\therefore f$ is not odd.

theorem.

\rightarrow If f is continuous on $[a,b]$

$\forall x \in [a,b] \rightarrow f$ attains its bounds.

(Q8)

$\forall x \in [-\frac{\pi}{2}, \frac{\pi}{2}],$ If f is conti. on $[a,b]$

$\forall x \in [a,b] \rightarrow f$ attains its supremum & infimum atleast once in $[a,b]$

Proof:

Let f be conti. on $[a,b]$

\rightarrow Then f is odd on $[a,b]$.

\therefore If f & $-f$ on $[a,b]$ exist.

Let $M = \sup f$ &

(S1)

$m = \inf f$ on $[a,b]$

(S2)

$\therefore f(x) \leq M \text{ & } f(x) \geq m$

on $[a,b]$

now we have to show that f attains its sup & inf atleast once in $[a,b]$.

i.e. $\exists x \in [a,b]$ such that

$$f(x) = M \text{ & } f(x) = m.$$

now if possible suppose that f doesn't attain M or m on $[a,b]$.

$$\therefore f(x) \neq M \text{ on } [a,b].$$

$$\therefore M - f(x) \neq 0 \text{ on } [a,b].$$

since M is constant it is continuous for all x

and f is continuous on $[a,b]$.

$\therefore M - f(x)$ is continuous on $[a,b]$

$$\Rightarrow \frac{1}{M-f(x)}$$
 is also conti. on $[a,b]$ ($\because M-f(x) \neq 0$)

$\therefore 1$ is odd on $[a,b]$.

\exists the real number K
(i.e. $K > 0$)
 $L + \frac{1}{1-f(x)} \leq K \forall x \in [a,b]$

$$\Rightarrow M - f(x) \geq \frac{L}{K} \text{ valid}$$

$$\Rightarrow M - \frac{1}{K} \geq f(a) \text{ valid}$$

$$\Rightarrow f(x) \leq M - \frac{1}{K} \text{ valid}$$

$$< M \forall x \in [a,b].$$

$\Rightarrow M - \frac{L}{K}$ is an upper bound
of f on $[a,b]$

and this upper bound less

than sup of f on $[a,b]$.

which is contradiction to
the hypothesis that

M is sup(lub) of f on $[a,b]$

$\therefore \exists x \in [a,b] \text{ s.t } f(x) = M$

$\therefore f$ attains its sup
at least once on $[a,b]$

susp: f attains its inf
at least once on $[a,b]$

Note: - The above theorem

is not true
if the interval is not
closed

Ex: - $f(x) = x \forall x \in [0,1)$

f is conti. on $(0,1]$

and is bdd on $(0,1]$

because $f(0) = 0$ $f(1) = 1$
 $\inf_{x \in (0,1]} f(x) < 1$ $\sup_{x \in (0,1]} f(x) < 1$

clearly f attains
sup. but not attains
inf on $[0,1]$

susp: f on $[0,1)$ attains
the infimum but
not the sup

susp: f on $(0,1)$ does not
attain inf & sup.

Note(2): The converse
of above theorem
need not be true

$$\text{Ex: } f(x) = \begin{cases} \sin\left(\frac{1}{x}\right) & ; x \neq 0 \\ 0 & ; x=0 \\ \forall x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right] \end{cases}$$

Theorem

If f is continuous
on $[a,b]$ then f is bdd
and attains its bound
at least once on $[a,b]$

proof: Above two theorems
proofs combined

→ Sign preservation theorem:

If f is continuous on $[a, b]$ and $a < c < b$ such that $f(c) \neq 0$, then $\exists \delta > 0$ such that $f(x)$ has the same sign as $f(c) \forall x \in (c-\delta, c+\delta)$.

(25)

Then → If a function f is continuous on $[a, b]$

and $f(a) \& f(b)$ are of opposite signs then \exists atleast one point $c \in (a, b)$ such that $f(c)=0$

→ Intermediate value theorem:

If f is continuous on $[a, b]$ and $f(a) \neq f(b)$ then f assumes every value between $f(a) \& f(b)$ atleast once.

Uniform Continuity-

w.r.t a function f is continuous at a point x_0 of an interval I , if given $\epsilon > 0$, $\exists \delta > 0$ such that $|f(x) - f(x_0)| \leq \epsilon$ whenever $|x - x_0| < \delta$.

Here δ depends, in general, not only on ϵ but also on the point x_0 at which the continuity of ' f ' is considered.

$$\text{i.e., } \delta = \delta(\epsilon, x_0)$$

For example:

$$f(x) = x^2 \quad \forall x \in \mathbb{R}$$

$$\text{Let } \epsilon = 1, \text{ & } x_0 = 0$$

$$\begin{aligned} \text{then } |f(x) - f(x_0)| &= |x^2 - 0| \\ &= |x^2| \\ &= |x|^2 < \epsilon \\ &\text{ whenever } |x| < \frac{\sqrt{\epsilon}}{1} \end{aligned}$$

Since $\epsilon = \frac{1}{4}$

$$\therefore |f(x) - f(x_0)| < \frac{1}{4} \text{ whenever } |x| < \frac{1}{2}$$

Taking $\delta = \frac{1}{2}$

$$|f(x) - f(x_0)| < \epsilon \text{ whenever } |x - x_0| < \delta.$$

$\therefore \delta = \frac{1}{2}$ works at $x_0 = 0$. Corresponding
to $\epsilon = \frac{1}{4}$

Now let $\epsilon = \frac{1}{4}$ and $x_0 = 1$, then $\delta = \frac{1}{2}$ does not work.

because: Let $x = 1.4$, then

$$|x - x_0| = |1.4 - 1| = 0.4 < \frac{1}{2}$$

$$\begin{aligned} \text{But } |f(x) - f(x_0)| &= |1.96 - 1| \\ &= 0.96 \neq \frac{1}{4} (\neq \epsilon) \end{aligned}$$

$\therefore \epsilon > 0$, the same value of δ does not work
for different points of the interval.

\therefore If a continuous function f is such that
given $\epsilon > 0$, we can find a uniform $\delta > 0$
which depends only on ϵ and not on the
point x_0 at which the continuity is
considered, then we say that f is uniformly
continuous.

Defn: A function defined on an interval I is
said to be uniformly continuous on I , if
given $\epsilon > 0$, \exists a $\delta > 0$ (depends on ϵ only)
such that $|f(x_1) - f(x_2)| < \epsilon$, whenever $|x_1 - x_2| < \delta$
where $x_1, x_2 \in I$.

Note: Uniform continuity of a function
is a global property we talk of.

- (26)
- ② Continuity on the other hand is a local property.
- ③ A function f is not uniformly continuous on \mathbb{R} if there is some $\epsilon > 0$ for which no $\delta > 0$ works such that i.e., for any $\delta > 0$, $\exists x_1, x_2 \in \mathbb{R}$ such that $|x_1 - x_2| < \delta \Rightarrow |f(x_1) - f(x_2)| \geq \epsilon$.

Problems

→ every constant function is uniformly continuous on \mathbb{R} .

Sol: Let $f(x) = c (\forall x \in \mathbb{R})$ constant function.

Gives $\epsilon > 0$,
now choosing $\delta > 0$ such that

$$|x_1 - x_2| < \delta ; x_1, x_2 \in \mathbb{R} \\ \Rightarrow |f(x_1) - f(x_2)| = |c - c| = 0 < \epsilon$$

∴ $f(x) = c (\forall x \in \mathbb{R})$ is uniformly continuous on \mathbb{R} .

→ The identity function $f(x) = x \forall x \in \mathbb{R}$ is uniformly continuous on \mathbb{R} .

Sol: Gives $f(x) = x \forall x \in \mathbb{R}$

Let $\epsilon > 0$ be given.
Let $x_1, x_2 \in \mathbb{R}$ such that $|x_1 - x_2| \leq \delta$.

Now we have

$$|f(x_1) - f(x_2)| = |x_1 - x_2| < \epsilon \text{ whenever } |x_1 - x_2| \leq \frac{\epsilon}{2}$$

Choosing $\delta = \frac{\epsilon}{2}$

$$\therefore |f(x_1) - f(x_2)| < \epsilon$$

∴ $f(x) = x$ is uniformly continuous on \mathbb{R} .

\Rightarrow Let $f(x) = x^2$ is uniformly continuous on $[-1, 1]$

Sol^b: Let $\epsilon > 0$ be given and let $x_1, x_2 \in [-1, 1]$
 $\Rightarrow x_1 \in [-1, 1] \text{ & } x_2 \in [-1, 1]$.

$$\Rightarrow -1 \leq x_1 \leq 1 \text{ & } -1 \leq x_2 \leq 1$$

$$\Rightarrow |x_1| \leq 1 \text{ & } |x_2| \leq 1.$$

Now we have

$$\begin{aligned} |f(x_1) - f(x_2)| &= |x_1^2 - x_2^2| \\ &= |(x_1 - x_2)(x_1 + x_2)| \\ &= |x_1 - x_2| |x_1 + x_2| \\ &\leq (|x_1| + |x_2|) (|x_1 - x_2|) \\ &\leq (1+1) |x_1 - x_2| \\ &= 2 |x_1 - x_2| \\ &\leq \epsilon \text{ whenever } |x_1 - x_2| < \frac{\epsilon}{2} \end{aligned}$$

Choosing $\delta = \frac{\epsilon}{2}$.

$$\therefore |f(x_1) - f(x_2)| < \epsilon \text{ whenever } |x_1 - x_2| < \delta.$$

$\therefore f$ is uniformly continuous
on $[-1, 1]$.

\Rightarrow Let $f(x) = \frac{x}{x+1}$ is uniformly continuous
on $[0, 2]$

Sol^b: Let $\epsilon > 0$ be given,

Let $x_1, x_2 \in [0, 2]$

$$\Rightarrow 0 \leq x_1 \leq 2, 0 \leq x_2 \leq 2 \quad \text{①}$$

We have

$$\begin{aligned} |f(x_1) - f(x_2)| &= \left| \frac{x_1}{x_1+1} - \frac{x_2}{x_2+1} \right| \\ &= \left| \frac{x_1 - x_2}{(x_1+1)(x_2+1)} \right| \\ &= \frac{|x_1 - x_2|}{|x_1+1||x_2+1|} \quad \text{②} \end{aligned}$$

27

$$\textcircled{1} \quad 1 < x_1 + 1 \leq 3 \quad \& \quad 1 \leq x_2 + 1 \leq 3 \\ \Rightarrow |x_1 + 1| \geq 1 \quad \& \quad |x_2 + 1| \geq 1 \\ \Rightarrow \frac{1}{|x_1 + 1|} \leq 1 \quad \& \quad \frac{1}{|x_2 + 1|} \leq 1$$

$$\textcircled{2} \quad |f(x_1) - f(x_2)| \leq M(1)(|x_1 - x_2|)$$

\Leftarrow whenever $|x_1 - x_2| < \frac{\epsilon}{M}$

Choosing $\delta = \frac{\epsilon}{M}$.

$$|f(x_1) - f(x_2)| \leq \epsilon \text{ whenever } |x_1 - x_2| < \delta$$

$\therefore f$ is uniformly continuous on $[0, 2]$

$$\rightarrow \text{S.T } f(x_1) = \frac{2x_1}{2x_1 - 1} \text{ is uniformly continuous on } [1, \infty)$$

Sol: Let $\epsilon > 0$, be given.

Let $x_1, x_2 \in [1, \infty)$

then $x_1 \geq 1 \quad \& \quad x_2 \geq 1 \quad \text{--- } \textcircled{1}$

we have

$$|f(x_1) - f(x_2)| = \left| \frac{2x_1}{2x_1 - 1} - \frac{2x_2}{2x_2 - 1} \right| \\ = \frac{2|x_1 - x_2|}{(2x_1 - 1)(2x_2 - 1)} \quad \text{--- } \textcircled{2}$$

$$\textcircled{1} \quad 2x_1 - 1 \geq 1 \quad \& \quad 2x_2 - 1 \geq 1$$

$$\Rightarrow |2x_1 - 1| \geq 1 \quad \& \quad |2x_2 - 1| \geq 1$$

$$\Rightarrow \frac{1}{|2x_1 - 1|} \leq 1 \quad \& \quad \frac{1}{|2x_2 - 1|} \leq 1.$$

$\textcircled{2} \quad$

we have

$$|f(x_1) - f(x_2)| \leq M(1)(2|x_1 - x_2|)$$

\Leftarrow whenever $|x_1 - x_2| < \frac{\epsilon}{2M}$

Choosing $\delta = \frac{\epsilon}{2M}$.

$$|f(x_1) - f(x_2)| \leq \epsilon \text{ whenever } |x_1 - x_2| < \delta$$

$\therefore f$ is uniformly continuous on $[1, \infty)$

Note: Every uniformly continuous is always continuous but not converse.
i.e., every continuous function need not be uniformly continuous.

for example:

$f(x) = x^2$ is continuous on \mathbb{R} , but not uniformly continuous on \mathbb{R} .

because:

Let $\epsilon > 0$ be given.

Now we shall show that for each $\delta > 0$,

$\exists x_1, x_2 \in \mathbb{R}$ such that $|x_1 - x_2| < \delta$

$$\Rightarrow |f(x_1) - f(x_2)| > \epsilon.$$

Taking $x_2 = x_1 + \frac{\delta}{2}$

$$\therefore |x_1 - x_2| = |x_1 - x_1 - \frac{\delta}{2}|$$

$$= \frac{\delta}{2} < \delta$$

$$\text{Now } |f(x_1) - f(x_2)| = |x_1^2 - x_2^2|$$

$$= |x_1 - x_2| |x_1 + x_2|$$

$$= \frac{\delta}{2} |x_1 + x_1 + \frac{\delta}{2}|$$

$$= \left(\frac{\delta}{2}\right) \left(2x_1 + \frac{\delta}{2}\right)$$

$$= x_1 \delta + \frac{\delta^2}{4} \quad (\because x_1 > 0)$$

$$> \epsilon.$$

Since $\frac{\delta^2}{4} > 0$ and $x_1 \delta < \epsilon \Rightarrow x_1 < \frac{\epsilon}{\delta}$; $x_1 > 0$.

$\epsilon + \delta$ is impossible, δ depends on ϵ & x_1

\therefore The given function is not uniformly continuous on \mathbb{R} .

\rightarrow If a function f is continuous on $[a, b]$ then it is uniformly continuous on $[a, b]$.

$$\text{Ex: } f(x) = x^2 + 5x + 3, \forall x \in [0, 4]$$

Geometrical Meaning of Derivative at a point:

Consider the curve $y = f(x)$ defined in an open interval (a, b) .

Let $x = c \in (a, b)$.

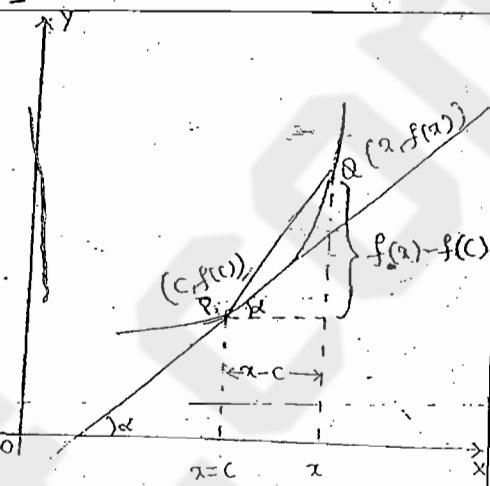

Let $y = f(x)$ be differentiable at $x = c$.

Let $P(c, f(c))$ be a point

on the curve $y = f(x)$.

and let $Q(x, f(x))$ be a

neighbouring point on the curve.

$$\text{Now the slope of the chord } PQ = \frac{f(x) - f(c)}{x - c} \quad [\text{i.e. } \frac{y_2 - y_1}{x_2 - x_1}]$$

Taking limit as $Q \rightarrow P$

i.e. $x \rightarrow c$, we get

$$\lim_{Q \rightarrow P} (\text{slope of the chord } PQ) = \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} \quad \textcircled{1}$$

As $Q \rightarrow P$, chord PQ becomes tangent at P .

from $\textcircled{1}$, we have

slope of the tangent at P .

$$= \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} = \left[\frac{d}{dx} (f(x)) \right]_{x=c} \quad \textcircled{2}$$

i.e., the derivative of a function at a point $x=c$ is

the slope of the tangent to the curve $y = f(x)$ at the point $(c, f(c))$.

If a function is not differentiable at $x=c$ only if the point $(c, f(c))$ is a corner point of the curve $y = f(x)$. i.e., the curve suddenly changes its direction.

at a point $(c, f(c))$.

→ Consider the function $f(x)$
defined on (a, b) .

Let $P(c, f(c))$ be a point on
the curve $y = f(x)$.

Let $Q(c-h, f(c-h))$ &
 $R(c+h, f(c+h))$ be two
neighbouring points on the left hand side (LHS) and RHS
respectively of the point P .

$$\text{Now slope of the chord } PQ = \frac{f(c-h) - f(c)}{(c-h) - c}$$

$$= \frac{f(c-h) - f(c)}{-h}$$

$$\text{and slope of chord PR} = \frac{f(c+h) - f(c)}{c+h - c}$$

$$= \frac{f(c+h) - f(c)}{h}$$

Now taking limit as $Q \rightarrow P$
i.e. $h \rightarrow 0$

$$\therefore \lim_{Q \rightarrow P} (\text{slope of chord } PQ) = \lim_{h \rightarrow 0} \frac{f(c-h) - f(c)}{-h} \quad \textcircled{1}$$

$$\text{similarly, } \lim_{R \rightarrow P} (\text{slope of chord PR}) = \lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h} \quad \textcircled{2}$$

As $Q \rightarrow P$ & $R \rightarrow P$, the chords PQ & PR become tangent
at P .

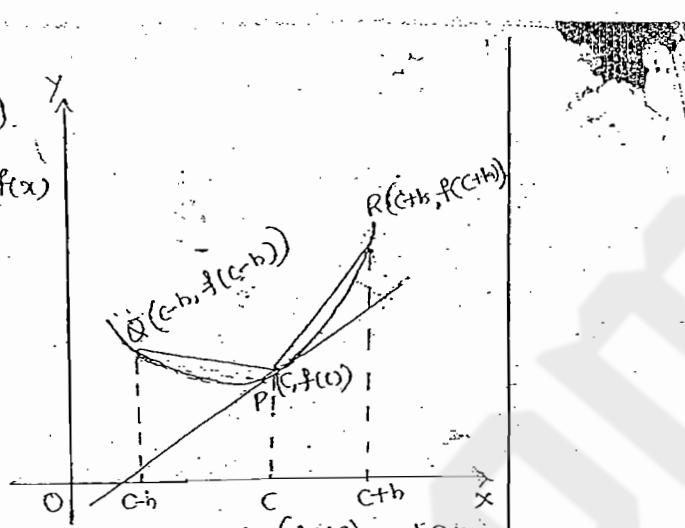

∴ from $\textcircled{1}$ & $\textcircled{2}$, we have the slope of the tangent at P .

$$\lim_{h \rightarrow 0} \frac{f(c-h) - f(c)}{-h} = \lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h}$$

∴ $f(x)$ is differentiable at $x=c$

$$\Leftrightarrow \lim_{h \rightarrow 0} \frac{f(c-h) - f(c)}{-h} = \lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h}$$

—————*

* Derivative of a function at a point:

Let $f: [a, b] \rightarrow \mathbb{R}$ be a function and $c \in (a, b)$, then f is said to be derivable (or differentiable) at c , if

$$\lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} \text{ (or) } \lim_{h \rightarrow 0} \frac{f(c+h) - f(c)}{h}$$

exists. The limit is called the derivative (or) the differential coefficient of the function f at $x=c$ and is denoted by $f'(c)$.

$$\text{i.e. } f'(c) = \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$$

(or)

Let $f: [a, b] \rightarrow \mathbb{R}$ and $c \in (a, b)$.

Then we say that a real number L is the derivative of f at c if given any $\epsilon > 0$, $\exists \delta(\epsilon) > 0$ such that if $x \in I$ satisfies

$$0 < |x - c| < \delta$$

$$\text{then } \left| \frac{f(x) - f(c)}{x - c} - L \right| < \epsilon$$

In this case, we say that f is differentiable at c and we write $f'(c)$ for L .

→ Left-hand Derivative:

Let $f: [a, b] \rightarrow \mathbb{R}$ be a function and $c \in (a, b)$ if

$$\lim_{x \rightarrow c^-} \frac{f(x) - f(c)}{x - c} \text{ (or) } \lim_{h \rightarrow 0^+} \frac{f(c-h) - f(c)}{-h}$$

exists.

then this limit is called the left-hand derivative of f at c and is denoted by $f'(c-0)$ (or) $Lf'(c)$ or $Lf'(c)$.

→ Right-hand Derivative:

Let $f: [a, b] \rightarrow \mathbb{R}$ be a function and $c \in (a, b)$.

$$\text{If } \lim_{x \rightarrow c^+} \frac{f(x) - f(c)}{x - c} \text{ (or) } \lim_{h \rightarrow 0^+} \frac{f(c+h) - f(c)}{h}$$

exists, then this limit is called the right hand derivative of f at c and denoted by $f'(c+)$ (or) $Rf'(c)$ (or) $Rf'(c)$.

Note :- The derivative $f'(c)$ exists

$$\Leftrightarrow Lf'(c) = Rf'(c).$$

→ Derivability in an interval:

* A function $f: [a, b] \rightarrow \mathbb{R}$ is said to be derivable in the open interval (a, b) if $f'(c)$ exists for each $c \in (a, b)$.

* A function $f: [a, b] \rightarrow \mathbb{R}$ is said to be derivable in $[a, b]$ if

i) $f'(c)$ exists at $c \in (a, b)$

ii) $Lf'(a)$ exists

iii) $Rf'(b)$ exists.

* A function $f: I \rightarrow \mathbb{R}$ is said to be derivable on I if f is derivable at every point of I .

$$\text{Ex:- } ① \quad f(x) = x^2 \quad \forall x \in \mathbb{R}$$

$$\text{let } x = c \in \mathbb{R}$$

$$\text{then } f(c) = c^2$$

$$\text{Now, } f'(c) = \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$$

$$= \lim_{x \rightarrow c} \frac{x^2 - c^2}{x - c}$$

$$= \lim_{x \rightarrow c} (x + c)$$

$$= 2c \text{ (exists)}$$

$\therefore f(x)$ is derivable function at $x = c \in \mathbb{R}$

$\therefore f'(x)$ is defined on \mathbb{R} and $f'(x) = 2x \quad \forall x \in \mathbb{R}$

$$\text{Ex:- } ② \quad f(x) = |x| \quad \forall x \in \mathbb{R}$$

$$\text{Sol'n: } f(x) = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

at $x = 0$, $f(0) = 0$.

$$\text{LHD} \quad Lf'(0) = \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0^-} \frac{-x - 0}{x}$$

$$= \lim_{x \rightarrow 0^-} (-1) = -1$$

$$\text{RHD: } Rf'(0) = \lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0^+} \frac{x - 0}{x}$$

$$= \lim_{x \rightarrow 0^+} (1) = 1$$

$\therefore Lf'(0) \neq Rf'(0)$

Theorem :- If $f: I \rightarrow \mathbb{R}$ has a derivative at $c \in I$ then f is continuous at 'c'.

Proof : Since f has a derivative at $c \in I$.

$$\therefore f'(c) = \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} \quad \forall c \in I \quad \text{--- (1)}$$

Now for $x \in I; x \neq c$,

we have:

$$f(x) - f(c) = \left(\frac{f(x) - f(c)}{x - c} \right) * (x - c)$$

Now applying limit on both sides at $x \rightarrow c$, we get

$$\lim_{x \rightarrow c} (f(x) - f(c)) = \lim_{x \rightarrow c} \left(\frac{f(x) - f(c)}{x - c} \right) (x - c)$$

$$= f'(c) \lim_{x \rightarrow c} (x - c) \quad (\text{by (1)})$$

$$= f'(c) \times 0$$

$$= 0$$

$$\therefore \lim_{x \rightarrow c} f(x) - \lim_{x \rightarrow c} f(c) = 0$$

$$\Rightarrow \lim_{x \rightarrow c} f(x) = f(c)$$

$\therefore f(x)$ is continuous at $x = c$.

Note: (i) The converse of the above theorem need not be true.

$$\text{Ex:- } f(x) = |x| \quad \forall x \in \mathbb{R}$$

$$= \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

At $x = 0$, $f(0) = 0$

$$\text{LHD} \quad \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} (-x)$$

$$= 0$$

Sol'n: Since f is derivable at $|x|=2$
i.e. at $x=2$

$\therefore f$ is continuous at $|x|=2$

Now LHL

$$\lim_{|x| \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} (ax + bx^2)$$

$$= \lim_{x \rightarrow 2^-} (a + b|x|^2)$$

$$= (a + 4b)$$

Now RHL

$$\lim_{|x| \rightarrow 2^+} f(x) = \lim_{x \rightarrow 2^+} \left(\frac{1}{|x|} \right)$$

$$= \frac{1}{2}$$

and at $|x|=2$, i.e. $x=2$

$$f(2) = a + 4b$$

Since f is continuous at $|x|=2$
 $\therefore \lim_{|x| \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^+} f(x) = f(2)$

$$\Rightarrow a + 4b = \frac{1}{2} = a + 4b$$

$$\Rightarrow a + 4b = \frac{1}{2} \quad \text{--- (1)}$$

Now LHD

$$\text{LH}'(2) = \lim_{|x| \rightarrow 2^-} \frac{f(x) - f(2)}{x - 2}$$

$$= \lim_{x \rightarrow 2^-} \frac{(ax + bx^2) - (a + 4b)}{x - 2}$$

$$= \lim_{x \rightarrow 2^-} \frac{bx^2 - 4b}{x - 2}$$

$$= \lim_{x \rightarrow 2^-} \frac{b(x^2 - 4)}{x - 2}$$

$$= \lim_{x \rightarrow 2^-} b(x + 2)$$

$$= b(2 + 2) = 4b.$$

Now RHD

$$\text{RH}'(2) = \lim_{|x| \rightarrow 2^+} \frac{f(x) - f(2)}{x - 2}$$

$$= \lim_{x \rightarrow 2^+} \left[\frac{\frac{1}{|x|} - (a + 4b)}{x - 2} \right]$$

$$= \lim_{x \rightarrow 2^+} \left[\frac{\frac{1}{|x|} - \frac{1}{2}}{x - 2} \right] \quad (\text{using (1)})$$

$$= \lim_{x \rightarrow 2^+} \left[\frac{2 - |x|}{2|x|(x-2)} \right]$$

$$= \lim_{x \rightarrow 2^+} \left[\frac{1x| - 2}{2|x|(x-2)} \right]$$

$$= \lim_{x \rightarrow 2^+} \left[\frac{6x - 12}{2|x|(x-2)} \right]$$

$$= \lim_{x \rightarrow 2^+} \left[\frac{1}{2|x|} \right]$$

$$= -\frac{1}{2(2)} = -\frac{1}{4}$$

Since f is derivable at $|x|=2$.

$$\therefore \text{LH}'(2) = \text{RH}'(2)$$

$$\Rightarrow 4b = -\frac{1}{4}$$

$$\Rightarrow b = -\frac{1}{16}$$

$$(1) \Rightarrow a + 4(-\frac{1}{16}) = \frac{1}{2}$$

$$\Rightarrow a - \frac{1}{4} = \frac{1}{2}$$

$$\Rightarrow a = \frac{1}{4}$$

$$\therefore a = \frac{1}{4} \text{ & } b = -\frac{1}{16}$$

Q3 For all real numbers x , $f(x)$ is given as

$$f(x) = \begin{cases} e^x + a \sin x & ; x < 0 \\ b(x-1)^2 + x-2 & ; x \geq 0 \end{cases}$$

Find the values of a & b for which f is differentiable at $x=0$.

Q4 The function f defined by

$$f(x) = \begin{cases} x^2 + 3x + a & \text{if } x \leq 1 \\ bx+2 & \text{if } x > 1 \end{cases}$$

is given to be derivable for every x . Find the values of a and b if $x=1$.

Q5 Since f is derivable for every x

f must be derivable at $x=1$

and hence f must be continuous at $x=1$.

Q6 For what choice of a & b , if y will be the function

$$f(x) = \begin{cases} ax+b & \text{if } x > 1 \\ bx^2 & \text{if } x \leq 1 \end{cases}$$

become differentiable at $x=1$?

Q7 (i) Determine if $f(x)$ has derivative at $x=0$ when

$$f(x) = \begin{cases} x \sin \frac{1}{x} & ; x \neq 0 \\ 0 & ; x=0 \end{cases}$$

Examine the function

$$f(x) = \begin{cases} x^2 \cos \frac{1}{x} & ; x \neq 0 \\ 0 & ; x=0 \end{cases}$$

for the existence of derivative at $x=0$.

Discuss the continuity and differentiability of the following functions at $x=a$.

$$(i), f(x) = \begin{cases} (x-a) \sin \left(\frac{1}{x-a} \right) & ; x \neq a \\ 0 & ; x=a \end{cases}$$

$$(ii), f(x) = \begin{cases} (x-a)^2 \sin \left(\frac{1}{x-a} \right) & ; x \neq a \\ 0 & ; x=a \end{cases}$$

Soln (i): since $x \rightarrow a^- \Rightarrow (x-a) \rightarrow 0^-$
 $\Rightarrow \frac{1}{x-a} \rightarrow -\infty$

$$\begin{aligned} x \rightarrow a+ &\Rightarrow (x-a) \rightarrow 0+ \\ &\Rightarrow \frac{1}{x-a} \rightarrow +\infty \end{aligned}$$

Continuous at $x=a$:

at $x=a$
 $f(a) = 0$

LHL $\lim_{x \rightarrow a^-} f(x) = \lim_{x \rightarrow a^-} (x-a) \sin \left(\frac{1}{x-a} \right)$
 $= 0 \times l \quad (\because -1 \leq l \leq 1)$
 $= 0$

RHL $\lim_{x \rightarrow a^+} f(x) = \lim_{x \rightarrow a^+} (x-a) \sin \left(\frac{1}{x-a} \right)$
 $= 0 \times l \quad (\because -1 \leq l \leq 1)$
 $= 0$

$\therefore \text{LHL} = \text{RHL} = f(0)$

$\therefore f$ is continuous at $x=a$.

Differentiable at $x=a$:

LHD: $\lim_{x \rightarrow a^-} \frac{(f(x) - f(a))}{x-a}$
 $= \lim_{x \rightarrow a^-} \frac{(x-a) \sin \frac{1}{x-a} - 0}{x-a}$
 $= \lim_{x \rightarrow a^-} \sin \left(\frac{1}{x-a} \right) = l$
 $\quad (\because -1 \leq l \leq 1)$

IIMS

INSTITUTE OF MATHEMATICAL SCIENCES
INSTITUTE FOR IAS/IIT/JEE EXAMINATION
NEW DELHI-110009
Mob: 09999197625

f is continuous and differentiable over each subinterval. The only doubtful points are the breaking points $x=1$ and $x=2$.

At $x=1$:

$$f(1) = 1$$

$$\begin{aligned} \text{LHL} &= \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} (3-2x) \\ &= 3-2(1) \\ &= 1 \end{aligned}$$

$$\begin{aligned} \text{RHL} &= \lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} (1) = 1 \end{aligned}$$

$$\therefore \text{LHL} = \text{RHL} = f(1)$$

$\therefore f$ is continuous at $x=1$.

Now LHD:

$$\begin{aligned} Lf'(1) &= \lim_{x \rightarrow 1^-} \frac{f(x)-f(1)}{x-1} \\ &= \lim_{x \rightarrow 1^-} \frac{3-2x-1}{x-1} \\ &= \lim_{x \rightarrow 1^-} \left(\frac{-2x+2}{x-1} \right) \\ &= -2 \lim_{x \rightarrow 1^-} \frac{(x-1)}{x-1} \\ &= -2(1) \\ &= -2 \end{aligned}$$

$$\begin{aligned} \text{RHD} : Rf'(1) &= \lim_{x \rightarrow 1^+} \frac{f(x)-f(1)}{x-1} \\ &= \lim_{x \rightarrow 1^+} \frac{1-1}{x-1} = 0 \end{aligned}$$

$$\therefore Lf'(1) \neq Rf'(1).$$

$\therefore f$ is not differentiable at $x=1$. similarly we can easily show that f is continuous at $x=2$ but not differentiable at $x=2$.

$\therefore f$ is continuous on $[0,3]$ also differentiable on $[0,3]$ except at $x=1$ and $x=2$.

H.W. Discuss the continuity and differentiability of the function

$$f(x) = |x-2| + 2|x-3| \text{ in } [1,4].$$

→ Determine where each of the following functions from $\mathbb{R} \rightarrow \mathbb{R}$ is differentiable and find derivative.

$$(A) f(x) = |x| + |x+1|$$

$$(B) g(x) = 2x + |x|$$

$$(C) h(x) = x|x|.$$

Sol'n: (A) $f(x) = |x| + |x+1|$ the value of f depends on

$$x < 0, x > 0;$$

$$x+1 > 0, x+1 < 0. \quad \begin{array}{c} x \\ \xleftarrow{-1} \xleftarrow{+1} \xleftarrow{+1} \\ -1 \quad 0 \end{array}$$

$$(Or) x+1 < 0, x+1 > 0 \Rightarrow x < 0, x > 0$$

$$\text{i.e. } x < -1, x > -1, x < 0, x > 0.$$

$$\text{i.e. } x < -1, -1 < x < 0; x > 0.$$

$$\text{If } x < -1; |x| = -x \text{ & } |x+1| = -(x+1)$$

$$\therefore f(x) = -2x-1$$

$$\text{If } -1 < x < 0; |x| = -x \text{ & } |x+1| = x+1$$

$$\therefore f(x) = 1$$

If $x > 0$; $|x| = x$ & $|2x+1| = x+1$
 $\therefore f(x) = 2x+1$

$$f(x) = \begin{cases} -2x-1 & , x < -1 \\ 1 & , -1 < x < 0 \\ 2x+1 & , x > 0 \end{cases}$$

$$\begin{aligned} f'(x) /_{x < -1} &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{-2(x+h)+1 - (-2x+1)}{h} \\ &= \lim_{h \rightarrow 0} \frac{-2h}{h} \\ &= \lim_{h \rightarrow 0} (-2) \\ &= -2 \end{aligned}$$

$$\begin{aligned} f'(x) /_{-1 < x < 0} &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \left(\frac{1-1}{h} \right) = 0 \end{aligned}$$

$$\begin{aligned} f'(x) /_{x > 0} &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{2(x+h)+1 - (2x+1)}{h} \\ &= \lim_{h \rightarrow 0} \frac{2h}{h} \\ &= \lim_{h \rightarrow 0} (2) \\ &= 2 \end{aligned}$$

$$\therefore f'(x) = \begin{cases} -2 & \text{if } x < -1 \\ 0 & \text{if } -1 < x < 0 \\ 2 & \text{if } x > 0. \end{cases}$$

② $f(x) = x|x|$

The value of f depends on $x < 0$ and $x > 0$.

If $x < 0$ then $|x| = -x$

$$\therefore f(x) = -x^2$$

If $x > 0$ then $|x| = x$

$$\therefore f(x) = x^2$$

$$f(x) = \begin{cases} -x^2 & \text{if } x < 0 \\ x^2 & \text{if } x > 0 \end{cases}$$

$$\begin{aligned} f'(x) /_{x < 0} &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{-(x+h)^2 - x^2}{h} \\ &= -2x \end{aligned}$$

$$\begin{aligned} \text{and } f'(x) /_{x > 0} &= \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{(x+h)^2 - x^2}{h} \\ &= 2x \\ \therefore f'(x) &= \begin{cases} -2x & ; x < 0 \\ 2x & ; x > 0 \end{cases} \\ &= 2|x|. \end{aligned}$$

Prove that if $f: \mathbb{R} \rightarrow \mathbb{R}$ is an even function (i.e. $f(-x) = f(x)$ $\forall x \in \mathbb{R}$)

and has a derivative at every point then the derivative f' is an odd function.

(i.e. $f'(-x) = -f'(x) \forall x \in \mathbb{R}$). Also

Examine its continuity and derivability at $x = \pi/2$:

→ show that the function defined by $f(x) = |x| + |x-1|$ is continuous but not derivable at $x=0$ and $x=1$.

Sol'n -

$$\begin{cases} x & x \\ \xrightarrow{x} & \xrightarrow{x} \end{cases}$$

$$0 \quad 1 \quad 2 \quad 3$$

$$x < 0; 0 \leq x \leq 1; x > 1$$

If $x < 0$:

$$\begin{aligned} |x| &= -x \\ |x-1| &= 1-x \end{aligned}$$

$$\therefore f(x) = 1-2x$$

If $0 \leq x \leq 1$; $|x| = x$,

$$|x-1| = 1-x$$

$$\therefore f(x) = 1$$

If $x > 1$:

$$|x| = x$$

$$|x-1| = x-1$$

$$\therefore f(x) = 2x-1$$

$$\therefore f(x) = 1-2x \text{ if } x < 0$$

$$\begin{cases} 1-2x & \text{if } 0 \leq x \leq 1 \\ 2x-1 & \text{if } x > 1 \end{cases}$$

Continuity at $x=0$:

Derivability at $x=0$: not

Continuity at $x=1$:

Derivability at $x=1$: not

→ show that the function $f(x)$

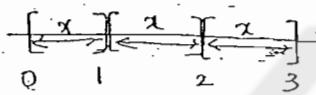

$$\text{defined by } f(x) = |x-1| + 2|x-2|.$$

is continuous but not derivable at 1 and 2.

→ Discuss the continuity and differentiability of the function.

$$f(x) = |x-1| + 2|x-2| \text{ in the interval } [0, 3]$$

Sol'n:

$$0 \leq x \leq 1; 1 \leq x \leq 2; 2 \leq x \leq 3.$$

If $0 \leq x \leq 1$

$$|x-1| = (1-x) &$$

$$|x-2| = 2-x$$

$$\therefore f(x) = 3-2x$$

If $1 \leq x \leq 2$

$$|x-1| = x-1 &$$

$$|x-2| = 2-x$$

$$\therefore f(x) = 1$$

If $2 \leq x \leq 3$

$$|x-1| = x-1 &$$

$$|x-2| = x-2$$

$$\therefore f(x) = 2x-3$$

$$\therefore f(x) = \begin{cases} 3-2x & \text{if } 0 \leq x \leq 1 \\ 1 & \text{if } 1 \leq x \leq 2 \\ 2x-3 & \text{if } 2 \leq x \leq 3 \end{cases}$$

Since f is a linear (Polynomial) function or Constant function over the various subintervals.

Here ℓ is finite but not fixed because it rotates with -1 to $+1$.

\therefore LHD does not exist.

Similarly RHD does not exist.

\therefore f is not differentiable at $x=0$

$$\text{Ques. } \rightarrow \text{Let } f(x) = \begin{cases} x^p \sin \frac{1}{x}; & x \neq 0 \\ 0; & x=0 \end{cases}$$

Obtain condition P so that

- (i) f is continuous at $x=0$ and
- (ii) f is differentiable at $x=0$.

Sol'n: (i) at $x=0$

$$f(0) = 0$$

$$\text{LHL } \lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} x^p (\sin \frac{1}{x}) \quad (1)$$

$$\text{RHL } \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} x^p (\sin \frac{1}{x}) \quad (2)$$

f is continuous at $x=0$

if the limits (1) & (2) both must be equal

this is possible only if

\therefore the required condition for

of f at $x=0$ is $P > 0$.

$$\text{iii, LHD } Lf'(0) = \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0^-} \frac{x^p \sin \frac{1}{x} - 0}{x}$$

$$= \lim_{x \rightarrow 0^-} x^{(p-1)} \sin \frac{1}{x} \quad (3)$$

$$\text{RHD } Rf'(0) = \lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0^+} \frac{x^p \sin \frac{1}{x} - 0}{x}$$

$$= \lim_{x \rightarrow 0^+} x^{(p-1)} \sin \frac{1}{x} \quad (4)$$

f is differentiable at $x=0$ if the limits (3) & (4) both must be zero.

This is possible only when $(P-1) > 0$. 5

\therefore the required condition for differentiability of f at $x=0$ is $P > 1$.

Ques:

$$\text{Let } f(x) = \begin{cases} x^m \sin \frac{1}{x}; & x \neq 0 \\ 0; & x=0 \end{cases}$$

what conditions should be imposed on m so that

i) f may be continuous at $x=0$.

ii) f may be differentiable at $x=0$.

Ques show that the following function is continuous at $x=1$, for all values of p .

$$f(x) = \begin{cases} px+1 & \text{if } x \geq 1 \\ x^p + p & \text{if } x < 1 \end{cases}$$

find the left-hand & right-hand derivatives of $f(x)$ at $x=1$.

Hence find the condition for the existence of the derivative at that point.

$$\text{Ques. Let } f(x) = \begin{cases} \frac{e^{yx} - e^{-yx}}{2y}; & x \neq 0 \\ 0; & x=0 \end{cases}$$

Show that f is continuous but not differentiable at $x=0$.

Ques A function $f(x)$ is defined as follows.

$$f(x) = \begin{cases} 1 + \sin x & \text{for } 0 < x < \pi/2 \\ 2 + (x - \pi/2)^2 & \text{for } x \geq \pi/2 \end{cases}$$

Prove if $g: \mathbb{R} \rightarrow \mathbb{R}$ is a differentiable odd function then g' is an even function.

Soln:- ① Since f is even function

$$\therefore f(-x) = f(x) \quad \forall x \in \mathbb{R}$$

Let $x=c \in \mathbb{R}$ then

$$f(-c) = f(c)$$

$$\text{Now } g'(c) = \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} \quad ①$$

$$\text{Now } f(-c) = \lim_{x \rightarrow c} \frac{f(-x) - f(-c)}{-x - (-c)}$$

$$= \lim_{x \rightarrow c} \frac{f(x) - f(c)}{-(x - c)}$$

($\because f$ is even)

$$= - \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$$

$$= -f'(c) \quad (\text{from } ①)$$

$$\therefore f'(-c) = f'(c)$$

$\therefore f'$ is an odd function.

② Since g is odd function

$$\therefore g(-x) = -g(x) \quad \forall x \in \mathbb{R}$$

Let $x=c \in \mathbb{R}$ then $g(-c) = -g(c)$

$$\text{Now } g'(c) = \lim_{x \rightarrow c} \frac{g(x) - g(c)}{x - c} \quad ②$$

$$\text{Now } g'(-c) = \lim_{x \rightarrow c} \frac{g(-x) - g(-c)}{-x - (-c)}$$

$$= \lim_{x \rightarrow c} \frac{-g(x) + g(c)}{-(x - c)}$$

$$= \lim_{x \rightarrow c} \frac{g(x) - g(c)}{x - c}$$

$$= g'(c)$$

$$\therefore g'(-c) = g'(c)$$

$$\therefore g'(-x) = g'(x)$$

$\therefore g'$ is an even function.

P.R. \Rightarrow Let $f(x)$ ($x \in (-\pi, \pi)$) be defined

by $f(x) = \sin|x|$. Is f continuous on $(-\pi, \pi)$? If it is continuous, then is it differentiable on $(-\pi, \pi)$?

$$\text{Soln:- } f(x) = \sin|x| = \begin{cases} \sin x & x \geq 0 \\ \sin(-x) & x < 0 \end{cases} \quad \forall x \in (-\pi, \pi)$$

$$= \begin{cases} \sin x & x \geq 0 \\ -\sin x & x < 0 \end{cases} \quad \forall x \in (-\pi, \pi)$$

\Rightarrow Let $g: \mathbb{R} \rightarrow \mathbb{R}$ be defined by

$$g(x) = \begin{cases} x^2 \sin(1/x^2) & \text{for } x \neq 0 \\ 0 & \text{for } x=0 \end{cases}$$

Show that g is differentiable for all $x \in \mathbb{R}$.

Also show that the derivative g' is not bounded on the interval $[-1, 1]$.

$$\text{Soln:- } g(x) = \lim_{x \rightarrow 0} \frac{x^2 \sin(1/x^2) + 2x(-2/x^3) \cos(1/x^2)}{x^2} \\ = 2x \sin(1/x^2) - \frac{2}{x} \cos(1/x^2) \quad ①$$

$\therefore g'(x)$ is well defined for $x \neq 0$.

Now at $x=0$:

$$g(0) = 0$$

$$\therefore g'(0) = \lim_{x \rightarrow 0} \frac{g(x) - g(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0} \frac{x^{\alpha} \sin(\frac{1}{x^2}) - 0}{x - 0}$$

$$= \lim_{x \rightarrow 0} x^{\alpha} \sin\left(\frac{1}{x^2}\right)$$

Now we have

$$-1 \leq \sin\left(\frac{1}{x^2}\right) \leq 1 \quad \forall x \in \mathbb{R}; x \neq 0.$$

$$\Rightarrow -x^{\alpha} \leq x^{\alpha} \sin\left(\frac{1}{x^2}\right) \leq x^{\alpha} \quad \forall x > 0, \text{ is}$$

of the form

$$f(x) \leq g(x) \leq h(x)$$

$$\text{Here } f(x) = -x^{\alpha}; \quad t(x) = x^{\alpha} \sin\left(\frac{1}{x^2}\right)$$

$$h(x) = x^{\alpha}$$

$$\therefore \lim_{x \rightarrow 0} f(x) = 0, \quad \lim_{x \rightarrow 0} h(x) = 0$$

∴ By squeeze theorem

$$\lim_{x \rightarrow 0} x^{\alpha} \sin\left(\frac{1}{x^2}\right) = 0.$$

$$\therefore g'(0) = 0$$

∴ g is differentiable at $x=0$.

③ $\equiv g'(x)$ is not bounded.

on $[-1, 1]$ as $\alpha \in [-1, 1]$

If $\alpha > 0$ is a rational number

let $f: \mathbb{R} \rightarrow \mathbb{R}$ be defined by

$$f(x) = \begin{cases} x^{\alpha} \sin(\gamma_x) & ; x \neq 0 \\ 0 & ; x=0 \end{cases}$$

Determine these values of α for which $f'(0)$ exists.

Soln: At $x=0; f(0)=0$

$$\text{Now } f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0}$$

$$= \lim_{x \rightarrow 0} \frac{x^{\alpha} \sin(\gamma_x)}{x}$$

$$= \lim_{x \rightarrow 0} x^{\alpha-1} \sin(\gamma_x)$$

$$= \lim_{x \rightarrow 0} x^{\alpha-1} \lim_{x \rightarrow 0} \sin(\gamma_x)$$

$$= 0 \times \lim_{x \rightarrow 0} \sin(\gamma_x) \quad (\because \alpha > 0) \\ \Rightarrow (\alpha-1 > 0)$$

$$= 0$$

$f'(0)$ exists for $\alpha > 1$.

Extreme Value (Definition):

→ A real number x' is called an interior point of a set A if A is neighbourhood of x' .

i.e. $\exists \epsilon > 0$ such that $(x-\epsilon, x+\epsilon) \subset A$.

Ex:- (1) Every point of (a, b) is its interior point.

(2). Every point $[a, b]$ is its interior point except a & b .

→ The function $f: I \rightarrow \mathbb{R}$ is said to have a relative maximum (or) maximum value (or) maxima at $c \in I$ if $f(c)$ is the greatest value of the function f in a small neighbourhood $V = V_\delta(c)$ of c .

i.e. for all $x \in (c-s, c+s); s > 0$ such that $f(x) \leq f(c) \forall x \in V$.

→ The function $f: I \rightarrow \mathbb{R}$ is said to have a relative minimum (or) minimum value (or) minima at $c \in I$ if $f(c)$ is the least value of the function in a small neighbourhood $V = V_\delta(c)$ [i.e. $(c-s, c+s)$] of c .

i.e. for all $x \in (c-s, c+s); s > 0$ such that $f(x) \geq f(c) \forall x \in V$.

→ The function $f: I \rightarrow \mathbb{R}$ is said to

8

have relative extremum (or) extreme value at $c \in I$, iff f has either relative maximum (or) relative minimum at c .

Interior Extremum Theorem:

Let c be an interior point of the interval I at which $f: I \rightarrow \mathbb{R}$ has a relative extremum at c . If the derivative of f at c exists then $f'(c) = 0$.

Proof:- Since f has a relative extremum at c .

Suppose that f has a relative maximum at c .

INSTITUTE FOR ASPIRING SCIENTISTS
EXAMINATIONS
NEW DELHI-110059
Mob: 09999197625

$$f(x) \leq f(c) \quad \forall x \in V_\delta(c).$$

If possible let $f'(c) \neq 0$.
then $f'(c) > 0$ or $f'(c) < 0$.

Case(i): If $f'(c) > 0$

$$\text{i.e. } \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} > 0.$$

$$\therefore \frac{f(x) - f(c)}{x - c} > 0 \quad \forall x \in V_\delta(c); x \neq c$$

Now if $x \in V_\delta(c)$ and $x > c$
then $f(x) - f(c) = \frac{f(x) - f(c)}{x - c}(x - c) > 0$

$$\Rightarrow f(x) - f(c) > 0$$

$$\Rightarrow f(x) > f(c) \quad \text{--- (2)}$$

But (1) & (2) are contradiction.

$$\therefore f'(c) \neq 0 \quad \text{--- (1)}$$

Case ii): If $f'(c) < 0$ then

$$\text{If } \frac{f(x) - f(c)}{x-c} < 0$$

$$\therefore \frac{f(x) - f(c)}{x-c} < 0 \forall x \in V_s(c); \\ x \neq c$$

If $x \in V_s(c)$ and $x < c$ then

$$f(x) - f(c) = \left[\frac{f(x) - f(c)}{(x-c)} \right] \times (x-c) \\ > 0$$

$$\therefore f(x) - f(c) > 0$$

$$\Rightarrow f(x) > f(c) \quad \text{--- (3)}$$

But (1) & (3) are contradiction.

$$\therefore f'(c) \neq 0. \quad \text{--- (4)}$$

from (1) & (4)

$$f'(c) = 0$$

Note! (1) If f has relative extremum at 'c' then $f'(c)$ may not exist.
if it exists then $f'(c) = 0$.

$$\text{Ex!- } f(x) = |x| \forall x \in [-1, 1]$$

Sol'n Let $x = c = 0 \in [-1, 1]$

$$\text{for } x = V_s(0) \rightarrow 0$$

$$\Rightarrow x \in (-\delta, \delta)$$

$$(i) x \in (-\delta, 0)$$

$$\Rightarrow f(x) > f(0) = 0$$

$\therefore f(x)$ has minimum at $x=0$ $\forall x \in (-\delta, \delta)$

$$(ii) x \in (0, \delta)$$

$$\Rightarrow f(x) > f(0) = 0$$

$\therefore f(x)$ has minimum at $x=0$

$\therefore f$ has relative extremum at $x=0$

$$f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x-0}$$

$$= \lim_{x \rightarrow 0} \frac{|x| - 0}{x-0}$$

$$= \lim_{x \rightarrow 0^+} \frac{|x|}{x}$$

$$\text{Now } \lim_{x \rightarrow 0^-} \frac{|x|}{x} = \lim_{x \rightarrow 0^-} \frac{-(x)}{x}$$

$$= \lim_{x \rightarrow 0^-} (-1) = -1$$

$$\text{Now } \lim_{x \rightarrow 0^+} \frac{|x|}{x} = \lim_{x \rightarrow 0^+} \frac{x}{x} = \lim_{x \rightarrow 0^+} 1 = 1$$

$\therefore f'(0)$ does not exist.

Note (2): (a) The converse of above theorem need not be true.

If $f'_c(c) = 0$ then

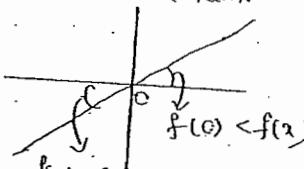

$f(c)$ may not be an extreme value.

$$\text{Ex!- } f(x) = x^3 \quad \forall x \in \mathbb{R}$$

$$\therefore f'(x) = 3x^2$$

$$\text{At } x=0; f'(0)=0.$$

But f is strictly increasing in \mathbb{R} and has no local extremum.

Definition:-

The point 'c' is said to be stationary point and $f(c)$ the stationary value of the function f if $f'(c) = 0$.

*Rolle's Theorem :- [Only Problems]

Suppose that f is continuous on $I = [a, b]$ that the derivative f'

exists at every point of (a, b)
and $f(a) = f(b) = 0$. Then there exists at least one point $c \in (a, b)$ such that $f'(c) = 0$.

Proof : Case(i)

If $f(x) = 0$ on $I = [a, b]$ then

$$f'(x) = 0 \forall x \in [a, b]$$

$$\therefore f'(c) = 0 \forall c \in (a, b)$$

Case(ii)

If $f(x) \neq 0 \forall x \in [a, b]$ then $f(x) > 0$ or $f(x) < 0$.

Suppose that $f(x) > 0 \forall x \in [a, b]$

i.e. f assumes the five values in $I = [a, b]$

Since f is continuous on $I = [a, b]$

$\therefore f$ attains its supremum (lub) at least once in $[a, b]$.

i.e. let f attains its supremum at some point $c \in [a, b]$.

$$\therefore f(c) = \sup \{ f(x) / x \in I = [a, b] \} > 0$$

at $x = c \in I$

$$\Rightarrow x \in (c-s, c+s)$$

Since f takes some five values.

$$\therefore f(x) \leq f(c)$$

$$\forall x \in I \cap (c-s, c+s)$$

$\therefore f$ has relative maximum at c .

INSTITUTE OF MATHEMATICAL SCIENCES
INSTITUTE FOR IAS/IECS EXAMINATION
NEW DELHI-110029

From **9** Regd. No: 05999197625

$$f(c) > 0.$$

$$\text{since } f(a) = f(b) = 0$$

$$\text{and then } c \neq a, c \neq b$$

$$\Rightarrow c \in (a, b)$$

Since f' exists at every point of (a, b) .

$\therefore f'(c)$ exists.

$\therefore f$ has relative maximum at c and f has derivative at c .

\therefore By interior extremum theorem

$$\therefore f'(c) = 0$$

for at least one point $c \in (a, b)$.
Hence the theorem.

* failure of Rolle's theorem :-

Rolle's theorem fails to hold good for a function which does not satisfy all three conditions of the theorem.

The theorem is not applicable if

their (i) f is not continuous in $[a, b]$

(ii) (iii) f is not derivable in (a, b)

(iv) $f(a) \neq f(b)$.

Note: The converse of Rolle's theorem is not true i.e. $f'(c) = 0$ at $c \in (a, b)$ without $f(x)$ satisfying all the three conditions of Rolle's theorem.

Ex:-

$$f(x) = \begin{cases} 0 & \text{when } 0 \leq x \leq 1 \\ x+1 & \text{when } 1 < x \leq 2 \end{cases} \quad \forall x \in [0, 2].$$

Clearly f is not continuous and not

derivable at $x=1$.

$\therefore f$ is not continuous in $[0, 2]$ and
 f is not derivable in $(0, 2)$.

Also $f(0) \neq f(2)$.

But $f(x)=0 \forall x \in (0, 1) \subset (0, 2)$.

i.e. $f'(x)=0$ for at least one point $x \in (0, 2)$.

Note(2): Another form of Rolle's theorem.

If f is continuous on $[a, a+h]$

derivable on $(a, a+h)$ and

$f(a)=f(a+h)=0$. then ~~that~~ at least

one real number $\theta \in (0, 1)$ such that $f'(a+\theta h)=0$.

Here. $b=a+h$; $h>0$ and $c=a+\theta h$

since $c \in (a, b)$

$$\Rightarrow a < c < b$$

$$\Rightarrow a < a+\theta h < a+h$$

$$\Rightarrow 0 < \theta h < h$$

$$\Rightarrow 0 < \theta < 1 \quad (\because h>0)$$

$$\Rightarrow \theta \in (0, 1).$$

Problems:

Verify Rolle's theorem in the following cases:

$$(i) f(x) = (x-a)^m (x-b)^n$$

where m & n are the integers

in the interval $[a, b]$.

Sol'n :- we have

$$f(x) = (x-a)^m (x-b)^n$$

(i) Since m & n are +ve integers.

$\therefore f(x)$ is polynomial in x .

(On expansion by binomial theorem).

Since every polynomial function is continuous function of x for all values of x .

$\therefore f(x)$ is continuous function for all values of x .

\therefore It is continuous on $[a, b]$.

$$(ii) f'(x) = m(x-a)^{m-1} (x-b)^n + n(x-a)^m (x-b)^{n-1}$$

$$= (x-a)^{m-1} (x-b)^{n-1} [m(x-b) + n(x-a)]$$

$$= (x-a)^{m-1} (x-b)^{n-1} [(m+n)x - (mb+na)]$$

exists in (a, b)

$\therefore f(x)$ is derivable in (a, b) .

$$(iii) f(a) = f(b) = 0.$$

$\therefore f(x)$ satisfies all the three conditions of Rolle's theorem.

$\therefore \exists$ at least one value $x=c \in (a, b)$ such that $f'(c)=0$

$$f'(c) = (c-a)^{m-1} (c-b)^{n-1} [c(m+n) - (mb+na)]$$

$$= 0$$

$$\Rightarrow c(m+n) - (mb+na) = 0$$

$$(\because c \neq a, c \neq b)$$

$$\Rightarrow c(m+n) = mb+na$$

$$\Rightarrow c = \frac{mb+na}{m+n} \in (a, b)$$

\therefore Rolle's theorem is verified.

$$\text{Hence } f(x) = (x-a)^3(x-b)^4 \forall x \in [a,b]$$

$$\rightarrow f'(x) = 2+(x-1)^{2/3} \forall x \in [0,2]$$

$$\text{Soln: Since } f'(x) = \frac{2}{3}(x-1)^{-1/3}$$

$$= \frac{2}{3(x-1)^{1/3}}$$

which does not exist in $x=1 \in (0,2)$

$\therefore f'(x)$ does not exist in $(0,2)$

$\therefore f$ is not derivable in $(0,2)$.

\therefore Rolle's theorem is not applicable to $f(x)$ in $[0,2]$.

$$\rightarrow f(x) = e^x \sin x \forall x \in [0,\pi]$$

Soln: (i) since e^x & $\sin x$ are both continuous functions for values of x .

$\therefore e^x \sin x$ is also continuous for all values of x .

$\therefore f(x)$ is continuous in $[0,\pi]$.

$$(ii), f'(x) = e^x \cos x + e^x \sin x$$

which exists in $(0,\pi)$.

$\therefore f(x)$ is derivable in $(0,\pi)$.

$$(iii), f(0) = e^0 \sin(0)$$

$= 0$

$$f(\pi) = e^\pi \sin(\pi)$$

$= 0$

$$\therefore f(0) = f(\pi) = 0$$

\therefore The conditions of Rolle's theorem are satisfied.

\therefore At least one value $c \in (0,\pi)$ such that $f'(c) = 0$

$$f'(c) = e^c (\cos c + \sin c) = 0$$

$$\Rightarrow \cos c + \sin c = 0 \quad (\because e^c \neq 0)$$

$$\Rightarrow \cos c = -\sin c$$

$$\Rightarrow 1 = -\tan c$$

$$\Rightarrow \tan c = -1$$

$$\Rightarrow \tan c = -\tan(\pi/4)$$

$$\therefore c = \tan(\pi - \pi/4)$$

$$\Rightarrow c = \pi - \pi/4$$

$$\Rightarrow c = 3\pi/4 \in (0,\pi)$$

\therefore Rolle's theorem is verified.

$$\text{Hence } f(x) = x(x+3)e^{-x/2} \forall x \in [-3,0]$$

$$\rightarrow f(x) = |x| \forall x \in [-1,1]$$

Soln: (i) since $f(x) = |x|$ is continuous for all values of x .

\therefore It is continuous in $[-1,1]$.

(ii), since $f(x)$ is not derivable at $x=0 \in (-1,1)$

$\therefore f$ is not derivable in $(-1,1)$

\therefore The Rolle's is not applicable to

$$f(x) = |x| \text{ in } [-1,1]$$

$$\rightarrow f(x) = \log \left[\frac{x^2+ab}{x(a+b)} \right] \forall x \in [a,b]$$

$$0 \notin [a,b]$$

$$\text{Soln: (i), } f(x) = \log(x^2+ab) - \log(x(a+b))$$

$$= \log(x^2+ab) - \log x - \log(a+b)$$

\therefore It is continuous in $[a,b]$ $0 \notin [a,b]$

$$(ii), f'(x) = \frac{2x}{x^2+ab} - \frac{1}{x}$$

$$= \frac{x^2-ab}{x(x^2+ab)}$$

exists in (a,b)

$\therefore f(x)$ is derivable in (a, b) .

$$(ii) f(a) = \log \left[\frac{a^x + ab}{a(a+b)} \right]$$

$$= \log \left(\frac{a^x + ab}{a^2 + ab} \right)$$

$$= \log(1) = 0$$

$$f(b) = \log \left[\frac{b^x + ab}{b(a+b)} \right]$$

$$= \log(1) = 0$$

$$\therefore f(a) = f(b) = 0$$

The conditions of Rolle's theorem are satisfied.

\exists at least one point $c \in (a, b)$ such that $f'(c) = 0$.

$$f'(c) = \frac{c^2 - ab}{c(c^2 + ab)} = 0$$

$$\Rightarrow c^2 - ab = 0$$

$$\Rightarrow c^2 = ab$$

$$\Rightarrow c = \pm \sqrt{ab}$$

$$\Rightarrow c = \pm \sqrt{ab} \in (a, b)$$

\therefore Rolle's is verified. (neglecting $\mp \sqrt{ab}$)

H.W.

$$\rightarrow f(x) = \log \left(\frac{x^2 + 3}{4x} \right) \forall x \in [1, 3]$$

$$\rightarrow f(x) = x^2 - 6x + 8 \forall x \in [2, 4]$$

$$\rightarrow f(x) = 8x - x^2 \forall x \in [2, 6]$$

$$\rightarrow f(x) = \begin{cases} x^2 + 1 & \text{for } 0 \leq x \leq 1 \\ 3-x & \text{for } 1 \leq x \leq 2 \end{cases}$$

Sol': Here $f(x)$ is defined in $[0, 2]$

Since $f(x) = x^2 + 1$ for $0 \leq x \leq 1$ i.e. $x \in [0, 1]$

is a polynomial.

\therefore It is continuous & derivable.

Since $f(x) = 3-x$ for $1 \leq x \leq 2$ is a polynomial.

\therefore It is continuous & derivable in $[1, 2]$.

Since the domain of function $f(x)$ is $[0, 2]$ which is partitioned at $x=1$

we are not sure about the continuity and derivability of $f(x)$ at $x=1$.

$$\text{Now LHL } \lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} (x^2 + 1) = 2$$

$$\text{RHL } \lim_{x \rightarrow 1^+} f(x) = 2$$

$$\text{at } x=1 : f(1) = 2$$

$\therefore f$ is continuous at $x=1$.

$$\begin{aligned} \text{LHD} \quad f'(1) &= \lim_{x \rightarrow 1^-} \frac{f(x) - f(1)}{x - 1} \\ &= \lim_{x \rightarrow 1^-} \frac{x^2 + 1 - 2}{x - 1} \\ &= \lim_{x \rightarrow 1^-} \frac{(x-1)(x+1)}{x-1} \\ &= \lim_{x \rightarrow 1^-} (x+1) \end{aligned}$$

$$= \lim_{x \rightarrow 1^-} f(x)$$

$$= 2.$$

$$\begin{aligned} \text{RHD } 2f'(1) &= \lim_{x \rightarrow 1^+} \frac{f(x) - f(1)}{x - 1} \\ &= \lim_{x \rightarrow 1^+} \frac{3-x-2}{x-1} \\ &= \lim_{x \rightarrow 1^+} \frac{1-x}{x-1} \\ &= -1 \end{aligned}$$

$$\therefore \text{LHD} \neq \text{RHD}$$

$\therefore f$ is not derivable at $x=1$

$\therefore f$ is not derivable in $(0, 2)$

\therefore Rolle's theorem is not applicable to $f(x)$ in $[0, 2]$.

Imp

$$\begin{aligned} \text{Let } \frac{a_0}{n+1} + \frac{a_1}{n} + \frac{a_2}{n-1} + \dots + \frac{a_{n-1}}{2} + a_n = 0 \end{aligned}$$

Show that the function $a_0x^n + a_1x^{n-1} + \dots + a_n$ vanishes at least once in $(0, 1)$.

$$\begin{aligned} \text{Sol'n: Let } f(x) &= a_0 \frac{x^{n+1}}{n+1} + a_1 \frac{x^n}{n} \\ &\quad + a_2 \frac{x^{n-1}}{n-1} + \dots + \frac{a_{n-1}}{2} x^2 + a_n x \end{aligned}$$

$$\forall x \in [0, 1]$$

Since $f(x)$ is a polynomial

which is continuous & derivable for all x .

$\therefore f$ is continuous in $[0, 1]$ & derivable

in $(0, 1)$.

Also $f(0) = 0$.

$$\text{and } f(1) = \frac{a_0}{n+1} + \frac{a_1}{n} + \dots + \frac{a_{n-1}}{2} + a_n = 0 \text{ (given)}$$

\therefore The conditions of Rolle's theorem are satisfied.

$\therefore \exists$ atleast one point $x \in (0, 1)$ such that $f'(x) = 0$.

$$\begin{aligned} \Rightarrow f'(x) &= a_0 x^n + a_1 x^{n-1} + \dots + a_{n-1} x \\ &\quad + a_n = 0. \end{aligned}$$

H.W.: By Considering the function $(x-4) \log x$, show that the equation $x \log x = 4 - x$ is satisfied by at least one value of $x \in (1, 4)$.

$$\text{Sol'n: Let } f(x) = (x-4) \log x$$

\rightarrow Show that between any two roots of $e^x \cos x = 1$, \exists atleast one root of $e^x \sin x - 1 = 0$. i.e. $\sin x - e^{-x} = 0$

Sol'n: Let $\alpha = a$ & $\beta = b$ be two distinct roots of the given equation $e^x \cos x = 1$.

$$\begin{aligned} \therefore e^a \cos a &= 1 \quad \& e^b \cos b = 1 \\ \Rightarrow \cos a &= e^{-a} \quad \& \cos b = e^{-b} \quad \text{--- (1)} \end{aligned}$$

$$\text{Let } f(x) = -\cos x + e^{-x} \forall x \in [a, b]$$

(i) Since $\cos x$ & e^{-x} are continuous in $[a, b]$.

i. $f(x)$ is continuous in $[a, b]$

ii) $f'(x) = \sin x - e^{-x}$

which exists for all $x \in (a, b)$.

$\therefore f$ is derivable in (a, b) .

iii) $f(a) = -\cos a + e^{-a}$

$= 0 \quad (\text{by } \textcircled{1})$

& $f(b) = -\cos b + e^{-b}$

$= 0 \quad (\text{by } \textcircled{1})$

$\therefore f(a) = f(b) = 0$

∴ The conditions of Rolle's

Theorem are satisfied.

∴ ∃ at least one point $c \in (a, b)$
such that $f'(c) = 0$.

$$\Rightarrow f'(c) = \sin c - e^{-c} = 0$$

$$\Rightarrow \sin c = e^{-c}$$

$$\Rightarrow e^c \sin c - 1 = 0$$

$\Rightarrow x = c \in (a, b)$ is a root of
the equation $e^x \sin x - 1 = 0$

$\therefore e^x \sin x - 1$ has at least one root b/w
any two roots of the equation.

$$e^x \cos x = 1$$

To Prove that b/w any two
roots of $e^x \sin x = 1$, \exists at least
one real root of

$$e^x \cos x + 1 = 0$$

* Lagrange's Mean Value Theorem

Theorem: —

(First Mean Value theorem of Differential Calculus) —

Statement: Suppose that f is continuous on $I = [a, b]$ and f has a derivative in (a, b) . Then there exists at least one point $c \in (a, b)$ such that

$$f'(c) = \frac{f(b) - f(a)}{b-a}$$

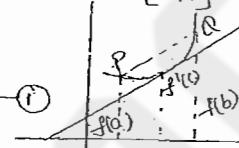

$$\text{i.e. } f(b) - f(a) = f'(c)(b-a)$$

Proof: Consider the function

$$\phi(x) = f(x) - f(a) - k(x-a) \quad \forall x \in [a, b]$$

where

$$k = \frac{f(b) - f(a)}{b-a} \quad \text{①}$$

Since $f(x)$ is continuous on $I = [a, b]$

since $(x-a)$ is polynomial it continuous on I and $f(a)$ & k are constants.

$\therefore \phi(x)$ is continuous on $[a, b]$.

Now $\phi'(x) = f'(x) - k$ exists in (a, b) ②

$\because f'(x)$ exists in (a, b)

Now $\phi(a) = 0$

and $\phi(b) = f(b) - f(a) - k(b-a)$

$$= (f(b) - f(a)) - \left(\frac{f(b) - f(a)}{b-a} \right) (b-a)$$

$$= 0$$

$$\therefore \phi(a) = \phi(b) = 0$$

$\therefore \phi(x)$ satisfies the conditions of Rolle's theorem.

$\therefore \exists$ at least one $c \in (a, b)$ such that

$$\phi'(c) = 0.$$

$$\phi'(c) = f'(c) - k = 0$$

$$\Rightarrow f'(c) = k$$

$$\Rightarrow f'(c) = \frac{f(b) - f(a)}{b-a}.$$

Another statement: —

If a function f defined on $[a, b]$ is

(i) Continuous on $[a, a+h]$

(ii), derivable on $(a, a+h)$ then \exists atleast one real number $\theta \in (0, 1)$ such that $f(a+h) = f(a) + h f'(a+\theta h)$

Here $b = a+h$

$$\& c = a+\theta h$$

* Deductions from Lagrange's

Mean Value theorem: —

→ If a function f is continuous on closed interval $I = [a, b]$ and derivable on (a, b) and $f'(x) = 0 \quad \forall x \in (a, b)$ then f is constant on $I = [a, b]$

Sol'n: Let x_1, x_2 (with $x_1 < x_2$) be any two distinct points of $[a, b]$ so that $[x_1, x_2] \subset [a, b]$

then f satisfies both conditions of Lagrange's mean value theorem on $[x_1, x_2]$.

$\therefore \exists c \in (x_1, x_2)$ such that

$$\frac{f(x_2) - f(x_1)}{x_2 - x_1} = f'(c) \quad (1)$$

But $f'(x) = 0 \quad \forall x \in (a, b)$ and

$$x_1 < c < x_2$$

$$f'(c) = 0$$

$$\text{from (1), } \frac{f(x_2) - f(x_1)}{x_2 - x_1} = 0 \quad \therefore$$

$$\Rightarrow f(x_2) - f(x_1) = 0$$

$$\Rightarrow f(x_1) = f(x_2)$$

Since x_1 & x_2 are any two distinct points of $[a, b]$.

it follows that f keeps the same value for every $x \in [a, b]$.

$f(x)$ is constant on $[a, b]$.

\rightarrow If two functions f & g are continuous on $[a, b]$, differentiable on (a, b) and $f'(x) = g'(x) \forall x \in (a, b)$ then $f-g$ is a constant on $[a, b]$

Qn: Let us consider $\phi(x) = f(x) - g(x) \quad \forall x \in [a, b]$

Since f & g continuous on $[a, b]$ and differentiable on (a, b) .

$\therefore \phi$ is continuous on $[a, b]$ and differentiable on (a, b) .

$\therefore \phi'(x) = f'(x) - g'(x)$ exists on (a, b) .

Since $f'(x) = g'(x) \quad \forall x \in [a, b]$

$\therefore \phi(x) = 0 \quad \forall x \in [a, b]$

Since ϕ is continuous on $[a, b]$, differentiable on (a, b) and

$$\phi'(x) = 0 \quad \forall x \in (a, b)$$

$\therefore \phi$ is a constant function on $[a, b]$.

i.e. $f-g$ is constant on $[a, b]$.

* Increasing and Decreasing Functions :

If in a part of the domain of the function $f(x)$,

$\rightarrow x_1 < x_2 \Rightarrow f(x_1) \leq f(x_2)$ then $f(x)$ is called monotonically increasing function in that part.

$\rightarrow x_1 < x_2 \Rightarrow f(x_1) < f(x_2)$ then $f(x)$ is called strictly monotonically increasing function in that part.

$$\rightarrow x_1 < x_2 \Rightarrow f(x_1) \geq f(x_2)$$

Monotonically decreasing.

$$\rightarrow x_1 < x_2 \Rightarrow f(x_1) > f(x_2)$$

Strictly Monotonically decreasing

Theorem:

Let $f: I \rightarrow \mathbb{R}$ be differentiable on I then

(a) f is increasing on I
iff $f'(x) \geq 0 \quad \forall x \in I$.

(b) f is decreasing on I
iff $f'(x) \leq 0 \quad \forall x \in I$.

Proof - (a) Suppose that $f'(x) \geq 0$
 $\forall x \in I$.

Let $x_1, x_2 \in I$ with $x_1 < x_2$,

so that $[x_1, x_2] \subset I$.

Since f is differentiable on I

$\therefore f$ is differentiable on $[x_1, x_2]$
and therefore it is continuous
on $[x_1, x_2]$.

$\therefore f$ satisfies both the conditions
of Lagrange's mean value theorem
on $[x_1, x_2]$.

$\therefore \exists c \in (x_1, x_2)$ such that

$$\frac{f(x_2) - f(x_1)}{x_2 - x_1} = f'(c).$$

$$\Rightarrow f(x_2) - f(x_1) = (x_2 - x_1)f'(c) \quad \text{--- (1)}$$

Since $x_1 < x_2 \Rightarrow x_2 - x_1 > 0$,

$f'(x) \geq 0 \quad \forall x \in I$ and $x_1 < c < x_2$

$$\Rightarrow f'(c) \geq 0.$$

\therefore from (1), $f(x_2) - f(x_1) \geq 0$

$$\Rightarrow f(x_1) \leq f(x_2).$$

$$\text{Since } x_1 < x_2 \Rightarrow f(x_1) \leq f(x_2)$$

$\therefore f$ is an increasing on I .

Conversely - Suppose that f is differentiable on I and f is an increasing on I .

Now for $x \neq c \in I$ then $x > c$ or $x < c$

Case i) if $x > c$ (i.e. $x - c > 0$)
then $f(x) \geq f(c)$. ($\because f$ is increasing
on I).

$$\Rightarrow f(x) - f(c) \geq 0$$

$$\Rightarrow \frac{f(x) - f(c)}{x - c} \geq 0 \quad (\because x - c > 0)$$

$$\Rightarrow \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} \geq 0 \quad \text{--- (2)}$$

Case ii) If $x < c$ (i.e. $x - c < 0$)
then $f(x) \leq f(c)$ ($\because f$ is increasing
on I)

$$\Rightarrow f(x) - f(c) \leq 0$$

$$\Rightarrow \frac{f(x) - f(c)}{x - c} \geq 0 \quad (\because x - c < 0)$$

$$\Rightarrow \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} \geq 0 \quad \text{--- (3)}$$

Since f is differentiable on I .

Let f be differentiable at $c \in I$.

$$f'(c) = \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c}$$

\therefore from (2) & (3)

we have

$$f'(c) \geq 0.$$

(b) The proof of part (b) is similar.

Problems:

* Verify Lagrange's mean value theorem for the following functions in the specified intervals:

$$\rightarrow f(x) = x(x-1)(x-2) \forall x \in [0, y_2]$$

Sol'n: $f(x) = x^3 - 3x^2 + 2x$ is a polynomial in x .

which is continuous in $[0, y_2]$.

$$f'(x) = 3x^2 - 6x + 2 \text{ exists in } (0, y_2)$$

$\therefore f$ is differentiable in $(0, y_2)$.

$\because f$ satisfies the conditions of Lagrange's Mean value theorem.

$\therefore \exists c \in (0, y_2)$ such that

$$f'(c) = \frac{f(y_2) - f(0)}{y_2 - 0}$$

$$\Rightarrow 3c^2 - 6c + 2 = \frac{3/8 - 0}{y_2}$$

$$\Rightarrow 3c^2 - 6c + 2 = \frac{3}{8}$$

$$\Rightarrow 12c^2 - 24c + 8 = 3$$

$$\Rightarrow 12c^2 - 24c + 5 = 0$$

$$\Rightarrow c = \frac{24 \pm \sqrt{576 - 240}}{24}$$

$$\Rightarrow c = \frac{24 \pm \sqrt{336}}{24}$$

$$\Rightarrow c = \frac{24 \pm 4\sqrt{21}}{24}$$

$$\Rightarrow c = \frac{6 \pm \sqrt{21}}{6}$$

Now the two values of c are

$$+ \frac{1}{6}\sqrt{21}, - \frac{1}{6}\sqrt{21}$$

In these, two values of c the second value $- \frac{1}{6}\sqrt{21} \in (0, y_2)$.

$\therefore \exists$ at least one value of c such that

$$c = - \frac{1}{6}\sqrt{21} \in (0, y_2) \text{ such that} \\ \frac{f(y_2) - f(0)}{y_2 - 0} = f'(c)$$

\therefore The Lagrange Mean value theorem is verified.

H.W.:

$$\rightarrow f(x) = x^2 - 3x + 2 \quad \forall x \in [-2, 3]$$

$$\rightarrow f(x) = x^3 + x^2 - 6x \quad \forall x \in [-1, 4]$$

$$\rightarrow f(x) = e^x \text{ on } [0, 1]$$

$$\rightarrow f(x) = \log x \quad \forall x \in [1, e] \text{ where } e = 2.71828$$

Sol'n: since $f(x) = \log x$ is continuous for all +ve values of x .

\therefore It is continuous on $[1, e]$ and

$$f'(x) = \frac{1}{x}$$
 exists in $(1, e)$.

$\therefore f$ is derivable in $(1, e)$

$\therefore f$ satisfies the conditions of

Lagrange's Mean value theorem.

$\therefore \exists$ at least one $c \in (1, e)$ such that

$$- f'(c) = \frac{f(e) - f(1)}{e - 1}$$

$$\Rightarrow c = \frac{\log e - \log 1}{e - 1}$$

$$\Rightarrow c = \frac{1 - 0}{e - 1}$$

$$\Rightarrow c-1 = c$$

$$\Rightarrow c = e-1 \in (1, e)$$

\therefore The Lagrange's Mean Value theorem is satisfied.

$$\text{Hence } f(x) = \sqrt{x^2-4} \quad \forall x \in [2, 4]$$

$$\Rightarrow f(x) = \begin{cases} 2 & \text{if } x=1 \\ x^2 & \text{if } 1 < x < 2 \\ 1 & \text{if } x=2 \end{cases}$$

Sol'n: Since $f(x) = x^2$ is a polynomial function in $1 < x < 2$ and every polynomial function is continuous for all values of x .

\therefore It is continuous on $(1, 2)$

Now at $x=1$:

$$f(1) = 2$$

$$\text{Now } \lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} x^2 = 1$$

$$\therefore \lim_{x \rightarrow 1^+} f(x) \neq f(1).$$

At $x=2$:

$$f(2) = 4$$

$$\text{Now } \lim_{x \rightarrow 2^-} f(x) = \lim_{x \rightarrow 2^-} x^2 = 4$$

$$\therefore \lim_{x \rightarrow 2^-} f(x) \neq f(2)$$

$\therefore f(x)$ is not continuous at $x=1$ & 2

$\therefore f(x)$ is continuous in $(1, 2)$ but not in $[1, 2]$

∴ $f(x)$ does not satisfy the conditions of Lagrange's Mean Value theorem.

\therefore Lagrange's Mean Value theorem is not applicable to $f(x)$.

$$\Rightarrow f(x) = |x| \quad \forall x \in [-1, 2]$$

Sol'n: It is continuous on $[-1, 2]$ and it is differentiable at each point in $(-1, 2)$ except at $x=0$.

$\therefore f(x)$ is not differentiable in $(-1, 2)$

$\therefore f(x)$ does not satisfy the

conditions of Lagrange's Mean Value

Lagrange's Mean Value theorem is not applicable to $f(x)$.

\therefore If $f(x) = (x-1)(x-2)(x-3)$; $a=0, b=4$ find c of Lagrange Mean Value theorem.

$$\text{Sol'n: } f(x) = (x-1)(x-2)(x-3)$$

$$= x^3 - 6x^2 + 11x - 6$$

$$f(a) = f(0)$$

$$= -6$$

$$f(b) = f(4)$$

$$= (3)(2)(1) = 6$$

$$f'(x) = 3x^2 - 12x + 11$$

$$f'(c) = 3c^2 - 12c + 11$$

$$f'(c) = \frac{f(b) - f(a)}{b-a}$$

$$\begin{aligned}
 3c^2 - 12c + 11 &= \frac{6 - (-6)}{4 - 0} \\
 \Rightarrow 3c^2 - 12c + 11 &= 12/4 \\
 \Rightarrow 3c^2 - 12c + 11 &= 3 \\
 \Rightarrow 3c^2 - 12c + 8 &= 0 \\
 \Rightarrow c &= \frac{12 \pm \sqrt{144 - 96}}{2 \times 3} \\
 \Rightarrow c &= \frac{12 \pm \sqrt{48}}{6} \\
 \Rightarrow c &= \frac{12 \pm 4\sqrt{3}}{6} \\
 \Rightarrow c &= 2 \pm \frac{2}{\sqrt{3}} \in (0, 4).
 \end{aligned}$$

$$\rightarrow f(x) = \frac{1}{x} + x \in [-1, 1]$$

Sol'n: $f(0)$ is not finite while $x \in [-1, 1]$.

LHL

$$\text{Lt } f(x) = -\infty \text{ as } x \rightarrow 0^-$$

RHL

$$\text{Lt } f(x) = \infty \text{ as } x \rightarrow 0^+$$

$\therefore f(x)$ is not continuous at $x=0$.

$\therefore f(x)$ is not continuous on $[-1, 1]$.

Lagrange's Mean Value theorem is not applicable to $f(x)$.

$$\text{Q. } f(x) = x^{2/3} \text{ in } [-1, 1].$$

$$\text{ot'n: } f'(x) = \frac{2}{3}x^{-1/3} = \frac{1}{3x^{2/3}}$$

does not exist at $x=0 \in (-1, 1)$

Lagrange's Mean Value theorem is

not applicable to $f(x)$.

$$\text{However, } \frac{f(1) - f(-1)}{1 - (-1)} = f'(c)$$

$$\Rightarrow \frac{1 - (-1)}{-2} = \frac{1}{3c^{2/3}}$$

$$\Rightarrow 3c^{2/3} = 1$$

$$\Rightarrow c^{2/3} = \frac{1}{3}$$

$$\Rightarrow c^{1/3} = \frac{1}{\sqrt{3}}$$

$$\Rightarrow c = \frac{1}{3\sqrt{3}} \in (-1, 1)$$

\therefore the hypothesis of Lagrange's Mean Value theorem is not valid.

i.e., the two conditions of Lagrange's Mean Value theorem are sufficient but not necessary.

\rightarrow show that if $x > 0$, $\log(1+x) > \frac{x}{1+x}$
and hence prove that $x^{-1} \log(\frac{1}{1+x})$ decreases monotonically as x increases from 0 to ∞ .

$$\begin{aligned}
 \text{Sol'n: Let } f(x) &= \log(1+x) - \frac{x}{1+x} \\
 f'(x) &= \frac{1}{1+x} - \left[\frac{(1+x) \cdot 1 - x}{(1+x)^2} \right] \\
 &= \frac{1}{1+x} - \frac{1}{1+x} + \frac{x}{(1+x)^2} \\
 &= \frac{x}{(1+x)^2} > 0 \quad (\because x > 0)
 \end{aligned}$$

$\therefore f'(x) > 0$ when $x > 0$

i.e. $f(x)$ is an increasing when

$$\therefore f(x) > f(0), \quad x > 0.$$

$$\text{Now } f(0) = \log(1+0) - \frac{0}{1+0} \\ = \log 1 - 0 \\ = 0$$

$$\therefore f(x) > 0$$

$$\Rightarrow \log(1+x) - \frac{x}{1+x} > 0$$

$$\Rightarrow \log(1+x) > \frac{x}{1+x}$$

$$\text{Let } F(x) = x^{-1} \log(1+x)$$

$$= \frac{\log(1+x)}{x}$$

$$F'(x) = \frac{x \cdot \frac{1}{1+x} - \log(1+x) \cdot 1}{x^2}$$

$$= \frac{-\left[\log(1+x) - \frac{x}{1+x}\right]}{x^2}$$

$$= -\frac{f(x)}{x^2} < 0 \text{ for } x > 0$$

(Since $f(x) > 0$)

$$\therefore F'(x) < 0 \text{ for } x > 0$$

$\therefore F(x)$ is an decreasing function

in $(0, \infty)$.

2004 P-I
→ Show that

$$x - \frac{x^2}{2} < \log(1+x) < x - \frac{x^2}{2(1+x)} ; x > 0$$

$$\text{Sol'n: Let } f(x) = x - \frac{x^2}{2} - \log(1+x)$$

$$\Rightarrow f(a+h) = f(a) + hf'(a) + \frac{h^2}{2!} f''(a+\theta h)$$

P-II [2004], P-I
2001 DM

A twice differentiable function f on $[a, b]$ is such that $f(a)=f(b)=0$

and $f'(c)>0$ for $a < c < b$.

Prove that there is at least

one value ξ , $a < \xi < b$ for which

$$f''(\xi) < 0.$$

Since f is twice differentiable on $[a, b]$

$$\Rightarrow f, f' \text{ exist on } [a, b]$$

$$\Rightarrow f, f' \text{ are differentiable on } [a, b]$$

f, f' are continuous functions on $[a, b]$.

Since $a < c < b$, applying

Lagrange's Mean Value theorem to on the intervals $[a, c]$ and $[c, b]$

we get

$$\frac{f(c)-f(a)}{c-a} = f'(z_1)$$

where $a < z_1 < c$ and

$$\frac{f(b)-f(c)}{b-c} = f'(z_2) \text{ where } c < z_2 < b$$

$$\text{But } f(a) = f(b) = 0$$

$$\therefore f'(z_1) = \frac{f(c)}{c-a}$$

$$f'(z_2) = \frac{f(c)}{b-c}$$

$$a < z_1 < c < z_2 < b$$

Again f' is continuous and derivable on $[z_1, z_2]$

∴ By Lagrange's Mean Value theorem we have

$$\frac{f'(z_2) - f'(z_1)}{z_2 - z_1} = f''(\xi)$$

$$\text{where } z_1 < \xi < z_2$$

Substituting the values of $f'(z_1)$ and $f'(z_2)$, we get

$$f''(\xi) = \frac{-f(c) - f(c)}{b-c - c-a} = \frac{-f(c)}{z_2 - z_1}$$

$$= \frac{-f(c)}{z_2 - z_1} \left[\frac{1}{b-c} - \frac{1}{c-a} \right]$$

$$= \frac{-f(c)}{z_2 - z_1} \left[\frac{b-a}{b-c} \right]$$

Since $a < z_1 < c < \xi < z_2 < b$ and $-f(c) > 0$

$\therefore f''(\xi) < 0$ where $a < \xi < b$.

Cauchy's Mean Value

Theorem (Second Mean Value theorem)

Statement: Let f and g be continuous on $[a, b]$ and differentiable on (a, b) and assume that $g'(x) \neq 0$.

$\forall x \in (a, b)$ then $\exists c \in (a, b)$

such that $\frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}$

Proof: Let $\phi(x) = f(x) - f(a) -$

$$\text{where } K = \frac{f(b) - f(a)}{g(b) - g(a)} \\ \therefore \phi(x) = f(x) - f(a) - K[g(x) - g(a)] \quad \forall x \in [a, b]$$

If possible, let $g(a) =$  $\phi(b) = \phi(a)$.

Since $g(x)$ is continuous on $[a, b]$ and differentiable on (a, b)

$\therefore g$ satisfies the conditions of Rolle's theorem.

$\exists c \in (a, b)$ such that $g'(c) = 0$.

which is contradiction to $g'(x) \neq 0$.

$$\forall x \in (a, b)$$

$\therefore g(a) \neq g(b)$

$\therefore \phi(x)$ is well defined.

since $f(x)$ & $g(x)$ are continuous functions on $[a, b]$.

and $f(a), g(a)$ and K are constants.

These are continuous for all x .

$\therefore \phi(x)$ is continuous on $[a, b]$.

and $\phi'(x) = f'(x) - kg'(x)$ exists on (a, b) .

because f & g are differentiable functions on (a, b) .

$\therefore \phi$ is differentiable function on (a, b) .

Now $\phi(a) = 0$

$$\text{and } \phi(b) = f(b) - f(a) - K[g(b) - g(a)]$$

$$= [f(b) - f(a)] - \frac{f(b) - f(a)}{g(b) - g(a)} [g(b) - g(a)]$$

 $\phi(b) = \phi(a)$.

$\phi(x)$ satisfies the conditions of Rolle's theorem.

$\therefore \exists c \in (a, b)$ such that $\phi'(c) = 0$

$$\text{But } \phi'(x) = f'(x) - kg'(x) \quad \forall x \in (a, b).$$

$$\Rightarrow \phi'(c) = f'(c) - kg'(c)$$

$$\Rightarrow 0 = f'(c) - kg'(c) \quad (\because \phi(c) = 0)$$

$$\Rightarrow f'(c) = kg'(c)$$

$$\Rightarrow K = \frac{f'(c)}{g'(c)}$$

$$\Rightarrow \frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}$$

* Another form of the statement:

If two functions f and g defined on $[a, a+h]$ are

- (i) Continuous on $[a, a+h]$
- (ii) differentiable on $(a, a+h)$
- (iii), $g'(x) \neq 0$ for any $x \in (a, a+h)$

then \exists at least one real number $\theta \in (0, 1)$ such that

$$\frac{f'(a+\theta h)}{g'(a+\theta h)} = \frac{f(a+h)-f(a)}{g(a+h)-g(a)}$$

\rightarrow If f', g' are continuous and differentiable on $[a, b]$ then show that for $a < c < b$.

$$\frac{f(b)-f(a)-(b-a)f'(a)}{g(b)-g(a)-(b-a)g'(a)} = \frac{f''(c)}{g''(c)}$$

Sol'n :- Let us consider

$$\phi(x) = f(x) + (b-x)f'(x) + K\{g(x) + (b-x)g'(x)\}$$

$\forall x \in [a, b]$

where K is a constant to be determined such that $\phi(a) = \phi(b)$.

$$f(a) + (b-a)f'(a) + K[g(a) + (b-a)g'(a)]$$

$$= f(b) + Kg(b).$$

$$\Rightarrow K = \frac{f(b)-f(a)-(b-a)f'(a)}{g(a)+(b-a)g'(a)-g(b)}$$

since f, g' are continuous and differentiable functions on $[a, b]$.
 $\therefore \phi(x)$ is continuous and differentiable on $[a, b]$.

$\therefore \phi(x)$ satisfies the conditions of Rolle's theorem on an interval $[a, b]$.

$\therefore \exists c \in (a, b)$ such that $\phi'(c) = 0$.

$$\begin{aligned} \text{But } \phi'(x) &= f'(x) + (b-x)f''(x) - f'(x) \\ &\quad + K[g'(x) + (b-x)g''(x) - g'(x)] \\ &= (b-x)f''(x) + K(b-a)g''(x) \end{aligned}$$

$$\begin{aligned} \Rightarrow \phi'(c) &= (b-c)f''(c) + K(b-c)g''(c) \\ \Rightarrow 0 &= (b-c)f''(c) + K(b-c)g''(c) \\ (\because \phi'(c) = 0) \end{aligned}$$

$$\Rightarrow K = -\frac{f''(c)}{g''(c)} \quad (\because b-c \neq 0)$$

$$\Rightarrow \frac{f(b)-f(a)-(b-a)f'(a)}{g(b)-g(a)-(b-a)g'(a)} = \frac{-f''(c)}{g''(c)}$$

$$\Rightarrow \frac{f(b)-f(a)-(b-a)f'(a)}{g(b)-g(a)-(b-a)g'(a)} = \frac{f''(c)}{g''(c)}$$

P-II
2005

If $f'(x)$ and $g'(x)$ exist for all $x \in [a, b]$ and if $g'(x)$ does not vanish anywhere on (a, b) then prove that for some c between a and b :

$$\frac{f(c) - f(a)}{g(b) - g(c)} = \frac{f'(c)}{g'(c)}$$

Sol'n: Let us consider

$$\phi(x) = f(x)g(x) - f(a)g(a) - g(b)f(x) \quad \forall x \in [a, b]$$

Since f' and g' exists in $[a, b]$.

$\therefore f$ and g are derivable functions on $[a, b]$.

$\therefore f$ and g are continuous functions on $[a, b]$.

$\therefore \phi(x)$ is continuous and derivable on $[a, b]$.

and $\phi(a) = -f(a)g(b)$

$$\phi(b) = -f(a)g(b)$$

$$\therefore \phi(a) = \phi(b)$$

$\therefore \phi(x)$ satisfies the conditions of Rolle's theorem on $[a, b]$.

$\therefore \exists$ at least one point $c \in (a, b)$ such that $\phi'(c) = 0$

$$\text{But } \phi'(x) = f'(x)g(x) + f(x)g'(x)$$

$$= f(a)g'(x) - g(b)f'(x)$$

$$\Rightarrow \phi'(c) = f'(c)g(c) + f(c)g'(c)$$

$$= f(a)g'(c) - g(b)f'(c)$$

$$\Rightarrow 0 = f'(c)g(c) + f(c)g'(c)$$

$$= f(a)g'(c) - g(b)f'(c)$$

$$(\because \phi(c) = 0)$$

$$g'(c)[f(c) - f(a)] + f'(c)[g(c) - g(b)] = 0$$

$$\Rightarrow g'(c)[f(c) - f(a)] = -f'(c)[g(b) - g(c)]$$

$$\Rightarrow \frac{f(c) - f(a)}{g(b) - g(c)} = \frac{f'(c)}{g'(c)}$$

$$[\because g'(x) \neq 0 \forall x \in (a, b)]$$

Generalised Mean Value Theorem:

If three functions f, g and h defined on $[a, b]$ are

i) Continuous on $[a, b]$

ii) Differentiable on (a, b)

there exists a real number $c \in (a, b)$

such that $\begin{vmatrix} f(c) & g(c) & h(c) \\ f(a) & g(a) & h(a) \\ f(b) & g(b) & h(b) \end{vmatrix} = 0$.

Proof: Consider the function ϕ on $[a, b]$ defined by

$$\phi(x) = \begin{vmatrix} f(x) & g(x) & h(x) \\ f(a) & g(a) & h(a) \\ f(b) & g(b) & h(b) \end{vmatrix}$$

$$= f(x) \begin{vmatrix} g(a) & h(a) \\ g(b) & h(b) \end{vmatrix} - g(x) \begin{vmatrix} f(a) & h(a) \\ f(b) & h(b) \end{vmatrix} + h(x) \begin{vmatrix} f(a) & g(a) \\ f(b) & g(b) \end{vmatrix}$$

$$= A f(x) + B g(x) + C h(x)$$

where A, B, C are constants.

Since f, g, h are continuous

functions on $[a, b]$

$\therefore \phi(x)$ is continuous on $[a, b]$ and

f, g, h are differentiable on (a, b)

$\therefore \phi'(x)$ is differentiable on (a, b) and $\phi(a) = \phi(b) = 0$.

$\therefore \phi$ satisfies the conditions of Rolle's theorem.

$\exists c \in (a, b)$ such that $\phi'(c) = 0$. (1)

But $\phi'(x) = Af'(x) + Bg'(x) + ch'(x)$ in (a, b)

$$= \begin{vmatrix} f'(x) & g'(x) & h'(x) \\ f(a) & g(a) & h(a) \\ f(b) & g(b) & h(b) \end{vmatrix}$$

$$\Rightarrow \phi'(c) = \begin{vmatrix} f'(c) & g'(c) & h'(c) \\ f(a) & g(a) & h(a) \\ f(b) & g(b) & h(b) \end{vmatrix}$$

$$\Rightarrow 0 = \begin{vmatrix} f'(c) & g'(c) & h'(c) \\ f(a) & g(a) & h(a) \\ f(b) & g(b) & h(b) \end{vmatrix}$$

where $c \in (a, b)$.

\rightarrow when h is a constant function the above theorem reduces to

Cauchy's mean value theorem.

Let $h(x) = k$ (constant) then

$h(a) = h(b) = k$ and $h'(c) = 0$.

Substituting generalised mean value theorem, we get,

$$\begin{vmatrix} f(c) & g(c) & R \\ \hline f(a) & g(a) & k \\ f(b) & g(b) & k \end{vmatrix} = 0$$

$$\Rightarrow \frac{f'(c)}{g'(c)} = \frac{f(b)-f(a)}{g(b)-g(a)}$$

which is the Cauchy's Mean Value theorem.

\rightarrow when $g(x)=x$ and $h(x)=k$ (constant)
the above theorem (Generalised Mean Value) reduces to Lagrange's mean value theorem.

$$g(x)=x \text{ and } h(x)=k$$

$$\Rightarrow g'(x)=1 \text{ and } h'(x)=0$$

$$\Rightarrow g'(c)=1, h'(c)=0 \text{ and}$$

$$g(a)=a; g(b)=b; h(a)=h(b)=k$$

From generalised mean value theorem,

$$\begin{vmatrix} f'(c) & g'(c) & h'(c) \\ \hline f(a) & g(a) & h(a) \\ f(b) & g(b) & h(b) \end{vmatrix} = 0$$

$$\begin{vmatrix} f'(c) & 1 & 0 \\ \hline f(a) & a & k \\ f(b) & b & k \end{vmatrix} = 0$$

$$\Rightarrow f'(c) = \frac{f(b)-f(a)}{b-a}$$

which is the Lagrange's Mean Value theorem.

Problems:-

\rightarrow Verify Cauchy's Mean Value theorem for the following pairs of functions in the specified intervals.

$$f(x)=x^2 \text{ & } g(x)=x^3 \quad \forall x \in [1, 2]$$

Sol'n: Since f & g are continuous

on $[1, 2]$ and differentiable on $(1, 2)$.

$$\text{Also } g'(x)=3x^2 \neq 0 \text{ for any } x \in (1, 2)$$

f & g satisfy the conditions of Cauchy's Mean Value theorem.

$\therefore \exists c \in (1, 2)$ such that

$$\frac{f'(c)}{g'(c)} = \frac{f(2)-f(1)}{g(2)-g(1)} \quad \text{--- (1)}$$

$$\text{But } g'(x)=3x^2 \text{ & } f'(x)=2x$$

$$\therefore f'(c)=2c \text{ & } g'(c)=3c^2$$

$$(1) \equiv \frac{2c}{3c^2} = \frac{4-1}{8-1}$$

$$\Rightarrow \frac{2}{3c} = \frac{3}{7}$$

$$\Rightarrow 9c=14$$

$$\Rightarrow c = \frac{14}{9} \in (1, 2)$$

Cauchy's Mean Value theorem is verified.

→ Find 'c' of Cauchy's Mean Value Theorem for the following pairs of functions.

i) $f(x) = e^x$, $g(x) = e^{-x}$ $\forall x \in [a, b]$

Soln: $f(a) = e^a$; $f(b) = e^b$

$g(a) = e^{-a}$; $g(b) = e^{-b}$

$$f'(x) = e^x \Rightarrow f'(c) = e^c$$

$$g'(x) = -e^{-x} \Rightarrow g'(c) = -e^{-c}$$

$$\frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}$$

$$\Rightarrow \frac{e^c}{-e^{-c}} = \frac{e^b - e^a}{e^{-b} - e^{-a}}$$

$$\begin{aligned} \Rightarrow -e^{2c} &= \frac{-e^b - e^a}{\frac{1}{e^b} - \frac{1}{e^a}} \\ &= -[-e^b + e^a] \\ &= \frac{e^a - e^b}{e^a \cdot e^b} \\ &= -e^{a-b} \\ &= -e^{(a+b)} \end{aligned}$$

$$\Rightarrow 2c = a+b$$

$$\Rightarrow c = \frac{a+b}{2} \in (a, b)$$

H.W.

ii) $f(x) = x^2$, $g(x) = x$ $\forall x \in [a, b]$

iii) $f(x) = \sin x$, $g(x) = \cos x$ $\forall x \in [-\pi/2, 0]$

→ Show that $\frac{\sin \alpha - \sin \beta}{\cos \beta - \cos \alpha} = \cot \theta$

where $0 < \alpha < \theta < \beta < \pi/2$.

24
Soln: Let $f(x) = \sin x$

$$g(x) = \cos x \quad \forall x \in [\alpha, \beta]$$

Since f and g are both continuous on $[\alpha, \beta]$ and differentiable on (α, β) .

$$g'(x) = -\sin x \neq 0 \text{ for any } x \in (\alpha, \beta)$$

∴ By Cauchy's Mean value theorem

$\exists \theta \in (\alpha, \beta)$ such that

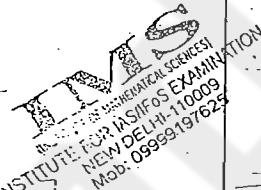

$$\frac{f'(c)}{g'(c)} = \frac{f(\beta) - f(\alpha)}{g(\beta) - g(\alpha)} \quad \text{.....(1)}$$

$$\text{But } f'(x) = \cos x; g'(x) = -\sin x$$

$$\Rightarrow f'(\theta) = \cos \theta; g'(\theta) = -\sin \theta$$

$$\text{①} \equiv \frac{\sin \beta - \sin \alpha}{\cos \beta - \cos \alpha} = \frac{\cos \theta}{-\sin \theta}; \theta \in (\alpha, \beta)$$

$$\Rightarrow \frac{\sin \alpha - \sin \beta}{\cos \alpha - \cos \beta} = \cot \theta, \theta \in (\alpha, \beta)$$

* Miscellaneous Problems :-

→ Assuming f'' to be continuous on $[a,b]$, show that

$$f(c) - f(a) \left(\frac{b-c}{b-a} \right) - \left(\frac{c-a}{b-a} \right) f(b) = \frac{1}{2} (c-a)(c-b) f''(\xi)$$

where c and ξ both lie in $[a,b]$
i.e. $c, \xi \in [a,b]$.

Sol: We have to show that

$$(b-a)f(c) - (b-c)f(a) - (c-a)f(b) = \frac{1}{2} (b-a)(c-a)(c-b) f''(\xi)$$

Let us consider the function for $x \in [a,b]$ defined by

$$\phi(x) = (b-a)f(x) - (b-x)f(a) - (x-a)f(b) - (b-a)(x-a)(x-b)k$$

where k is a constant to be determined such that $\phi(c) = 0$.

$$0 = (b-a)f(c) - (b-c)f(a) - (c-a)f(b) - (b-a)(c-a)(c-b)k$$

$$= \frac{(b-a)f(c) - (b-c)f(a) - (c-a)f(b)}{(b-a)(c-a)(c-b)}$$

Clearly $\phi(a) = \phi(b) = 0$ and $\phi(x)$ is differentiable in $[a,b]$.

The function ϕ satisfies all the

conditions of Rolle's theorem on each intervals $[a,c]$ and $[c,b]$.

∴ ∃ two numbers ξ_1, ξ_2 in (a,c) and (c,b) such that $\phi'(\xi_1) = 0$ and $\phi'(\xi_2) = 0$.

But $\phi'(x) = (b-a)f'(x) + f(a) - f(b) - (b-a)\{2x - (a+b)\}k$,

which is continuous on $[a,b]$ and derivable on (a,b) .

∴ Continuous and derivable on $[\xi_1, \xi_2]$.

Also $\phi'(\xi_1) = \phi'(\xi_2) = 0$

∴ By Rolle's theorem,

∃ $\xi \in (\xi_1, \xi_2)$ such that $\phi''(\xi) = 0$

But $\phi''(x) = (b-a)f''(x) - 2(b-a)k$.

∴ $f''(\xi) - 2k = 0$. ($\because b-a \neq 0$)
 $\phi''(\xi) = 0$)

$\Rightarrow k = \frac{1}{2} f''(\xi)$ where

$$a < \xi_1 < \xi < \xi_2 < b$$

(2)

from (1) & (2), we have

$$(b-a)f(c) - (b-c)f(a) - (c-a)f(b)$$

$$= (b-a)(c-a)(c-b)$$

$$= \frac{1}{2} f''(\xi)$$

$$\Rightarrow f(c) - \left(\frac{b-c}{b-a} \right) f(a) - \left(\frac{c-a}{b-a} \right) f(b)$$

$$= \frac{1}{2} (c-a)(c-b) f''(\xi).$$

INSTITUTE FOR IAS/IFS EXAMINATION

NEW DELHI-110009

Mob: 09999197320

Let R be the set of real numbers and $f: R \rightarrow R$ such that for all x and $y \in R$, $|f(x) - f(y)| \leq |x-y|^3$.

Prove that $f(x)$ is a constant function.

Soln: Given $|f(x) - f(y)| \leq |x-y|^3$

$$\forall x, y \in R \quad (1)$$

Let $y \in R$ and x be chosen

arbitrarily close to y but not equal to y .

$$\therefore (1) \equiv \left| \frac{f(x) - f(y)}{x-y} \right| \leq |x-y|^2$$

Taking limit when $x \rightarrow y$ we get

$$\lim_{x \rightarrow y} \left| \frac{f(x) - f(y)}{x-y} \right| \leq \lim_{x \rightarrow y} |x-y|^2$$

$$\Rightarrow \lim_{x \rightarrow y} \left| \frac{f(x) - f(y)}{x-y} \right| \leq \lim_{x \rightarrow y} (x-y)^2$$

$$\Rightarrow |f'(y)| = 0 \left[\because \lim_{x \rightarrow y} \frac{f(x) - f(y)}{x-y} = f'(y) \text{ and } f'(y) \geq 0 \right]$$

$$\Rightarrow f'(y) = 0$$

$f(x)$ is constant.

2004 Prove that an equation of the form $x^n = a$ where $n \in N$ and $a > 0$ is a real number, has a positive root.

(OR)

Show that $x^n - a = 0$ has at most one real -ve root if n is a

+ve integer.

Soln: Let $f(x) = x^n - a$

$$\text{then } f'(x) = nx^{n-1}$$

Since $f'(x) > 0$ for $x > 0$.

hence $f(x)$ is increasing on $(0, \infty)$.

Let $x_1, x_2 \in (0, \infty)$ and $0 < x_1 < x_2$ such that $f(x) \neq 0$.

$$\text{then } f(x_1) < f(x) < f(x_2) \quad (or)$$

$$f(x_1) < 0 < f(x_2)$$

\therefore This shows that if $x \neq a$, $f(x) \neq 0$ on $[0, \infty)$.

i.e. $x^n - a = 0$ has at most one real +ve root.

2008 Prove that $\frac{\tan x}{x} > \frac{x}{\sin x}$

Whenever $0 < x < \pi/2$.

$$\text{Soln: } \frac{\tan x}{x} - \frac{x}{\sin x} = \frac{\tan x - x \cos x}{x \sin x}$$

Since $x \sin x > 0 \forall x \in (0, \pi/2)$

\therefore we are enough to show that

$$\tan x \cdot \sin x - x^2 > 0 \quad \forall x \in (0, \pi/2)$$

$$\text{Let } f(x) = \tan x \cdot \sin x - x^2 \quad \forall x \in (0, \pi/2)$$

$$\begin{aligned} \Rightarrow f'(x) &= \sec^2 x \sin x + \tan x \cos x - 2x \\ &= \sin x (\sec^2 x + 1) - 2x \end{aligned}$$

We cannot decide about the sign of $f'(x)$ (because of the presence of $2x$ term)

$$\text{Let } g(x) = f'(x) \quad \forall x \in (0, \pi/2)$$

$$\Rightarrow g'(x) = \cos x (\sec^2 x +$$

$$\sin x (2\sec^2 x \tan x) - 2$$

$$= \sec x + \cos x - 2 + 2\sin^2 x \sec^3 x$$

$$= (\sqrt{\sec x} - \sqrt{\cos x})^2 - 2\sin^2 x \sec^3 x.$$

$$\text{Since } g'(x) > 0 \quad \forall x \in (0, \pi/2).$$

$\Rightarrow g(x)$ is an increasing function
(0, $\pi/2$).

$$\Rightarrow g(0) < g(x) \text{ in } 0 < x < \pi/2$$

$$\text{since } g(0) = 0$$

$$\therefore g(x) > 0$$

$$\Rightarrow f'(x) > 0 \text{ whenever } 0 < x < \pi/2$$

$\therefore f$ is an increasing function
in $0 < x < \pi/2$.

$$\Rightarrow f(0) < f(x)$$

$$\Rightarrow 0 < f(x)$$

$$\Rightarrow \tan x \sin x - x^2 > 0 \text{ in } (0, \pi/2).$$

$$\Rightarrow \frac{\tan x \sin x - x^2}{x \sin x} > 0$$

$$\Rightarrow \frac{\tan x}{x} - \frac{x}{\sin x} > 0$$

$$\Rightarrow \frac{\tan x}{x} > \frac{x}{\sin x} \text{ whenever } 0 < x < \pi/2$$

\rightarrow Prove that if f be defined for
all real x such that

$|f(x) - f(y)| < (x-y)^2$ then f is
constant.

Soln:- Here we have to show that
 $f'(x) = 0 \quad \forall x \in \mathbb{R}$.

$$\text{Let } a = c \in \mathbb{R}$$

Now we have

$$\left| \frac{f(a) - f(c)}{a - c} \right| = 0 \quad \text{for } a \neq c.$$

$$= \left| \frac{f(a) - f(c)}{a - c} \right|$$

$$= \frac{|f(a) - f(c)|}{|a - c|} < \frac{(a-c)^2}{|a-c|} = \frac{|a-c|^2}{|a-c|}$$

(by hyp).

$$= |a-c| < \epsilon \text{ whenever } |a-c| < \epsilon$$

$$\therefore \left| \frac{f(x) - f(c)}{x - c} \right| = 0 \quad \text{whenever}$$

$$|x-c| < \epsilon \text{ by choosing } \delta = \frac{\epsilon}{1}$$

$$\therefore \lim_{x \rightarrow c} \frac{f(x) - f(c)}{x - c} = 0$$

$$\text{i.e. } f'(c) = 0 \quad \forall c \in \mathbb{R}$$

$\Rightarrow f$ is constant function.

\rightarrow Find the interval in which the
function $f(x) = \sin(\log_e x) - \cos(\log_e x)$
is strictly increasing.

Soln: Given that

$$f(x) = \sin(\log_e x) - \cos(\log_e x)$$

Here domain is $x > 0$ as $\log_e x$

exists when $x > 0$,

$$\begin{aligned} f'(x) &= \frac{\cos(\log_e x) + \sin(\log_e x)}{x} \\ &= \frac{\sqrt{2} \left\{ \sin \frac{\pi}{4} \cos(\log_e x) + (\cos \frac{\pi}{4}) \sin(\log_e x) \right\}}{x} \\ &= \frac{\sqrt{2} \sin \left(\frac{\pi}{4} + \log_e x \right)}{x} \end{aligned}$$

Since $f(x)$ is strictly increasing when $f'(x) \geq 0$.

$$\text{i.e. } \sin \left(\frac{\pi}{4} + \log_e x \right) \geq 0$$

$$\Rightarrow 2n\pi \leq \frac{\pi}{4} + \log_e x \leq (2n+1)\pi \quad \forall n \in \mathbb{Z}$$

$$\Rightarrow 2n\pi - \frac{\pi}{4} \leq \log_e x \leq 2n\pi + \pi - \frac{\pi}{4}$$

$$\Rightarrow e^{2n\pi - \frac{\pi}{4}} \leq x \leq e^{2n\pi + \frac{3\pi}{4}}$$

$\therefore f(x)$ is strictly increasing when

$$x \in \left[e^{2n\pi - \frac{\pi}{4}}, e^{2n\pi + \frac{3\pi}{4}} \right]$$

$$\Rightarrow \text{Let } g(x) = f(x) + f(1-x)$$

$$\text{and } f''(x) > 0 \quad \forall x \in (0,1)$$

find the intervals of increase and decrease of $g(x)$.

Sol'n:- We have

$$g(x) = f(x) + f(1-x) \quad \text{--- (1)}$$

$$\text{then } g'(x) = f'(x) - f'(1-x) \quad \text{--- (2)}$$

$$\text{since } -f''(x) > 0 \quad \forall x \in (0,1)$$

$\therefore f'(x)$ is increasing on $(0,1)$.

INSTITUTE OF MATHEMATICAL SCIENCES

23

Hence two cases:

Case(i): $x > 1-x$ and $f'(x)$ is increasing $\Leftrightarrow x > \frac{1}{2}$ in $(0,1)$

$$\Rightarrow f'(1-x) < f'(x) \quad \forall x > \frac{1}{2}$$

$$\Rightarrow f'(x) - f'(1-x) > 0 \quad \forall x > \frac{1}{2}$$

$$\therefore g'(x) > 0 \quad \forall x > \frac{1}{2} \text{ in } (0,1)$$

$$\text{i.e. } g'(x) > 0 \quad \forall x \in \left(\frac{1}{2}, 1 \right)$$

$\Rightarrow g(x)$ is increasing in $\left(\frac{1}{2}, 1 \right)$.

Case(ii)

$x < 1-x$ and $f'(x)$ increasing for $0 < x < \frac{1}{2}$ in $(0,1)$.

$$\Rightarrow f'(x) < f'(1-x) \text{ for } 0 < x < \frac{1}{2}$$

$$\Rightarrow f'(x) - f'(1-x) < 0 \text{ for } 0 < x < \frac{1}{2}$$

$$\Rightarrow g'(x) < 0 \quad \forall x \in (0, \frac{1}{2})$$

$\Rightarrow g(x)$ is decreasing function in $(0, \frac{1}{2})$.

→ show that

$$\frac{x}{\pi} < \frac{\sin x}{x} < 1, \quad 0 < x < \frac{\pi}{2}$$

Sol'n:- Let

$$f(x) = \begin{cases} \frac{\sin x}{x} & x \neq 0 \\ 1 & x=0 \quad \forall x \in [0, \frac{\pi}{2}] \end{cases}$$

then f is continuous in $[0, \pi/2]$

and derivable in $(0, \pi/2)$

and $f'(x) = \frac{x\cos x - \sin x}{x^2}$,

$$x \in (0, \pi/2) \quad \text{--- (1)}$$

Let $F(x) = x\cos x - \sin x; x \in (0, \pi/2)$

$$F'(x) = \cos x - x\sin x - \cos x$$

$$= -x\sin x$$

$$< 0; x \in (0, \pi/2)$$

$\therefore F$ is decreasing in $(0, \pi/2)$

$\therefore F(x) < F(0)$ for $x > 0$ in $(0, \pi/2)$

$\Rightarrow F(x) < 0$ for $x \in (0, \pi/2)$

$$(\because F(0) = 0)$$

$\Rightarrow f'(x) < 0; x \in (0, \pi/2)$

$\therefore f(x)$ is decreasing in $(0, \pi/2)$

$\Rightarrow f(0) > f(x) > f(\pi/2)$ for

$$0 < x < \pi/2$$

$$\Rightarrow 1 > \frac{\sin x}{x} > \frac{2}{\pi}$$

$$\Rightarrow \frac{2}{\pi} < \frac{\sin x}{x} < 1 \quad \forall x \in (0, \pi/2)$$

Taylor's Theorem:

24

statement:

If a function f is defined on $[a, b]$, is such that
 i) the $(n-1)^{th}$ derivative $f^{(n-1)}$ is continuous on $[a, b]$
 ii) the n^{th} derivative $f^{(n)}$ exists on (a, b) .
 then there exist at least one real number $c \in (a, b)$ such that $f(b) = f(a) + (b-a)f'(a) + \frac{(b-a)^2}{2!}f''(a) + \dots + \frac{(b-a)^{n-1}}{(n-1)!}f^{(n-1)}(a) + \frac{(b-a)^n}{n!}f^{(n)}(c)$ where p is a given +ve integer.

proof: Let $G(x) = f(x) - \left(\frac{b-x}{b-a}\right)^p F(a)$

$$\text{where } F(x) = f(b) - f(x) - (b-x)f'(x) - \frac{(b-x)^2}{2!}f''(x) - \dots - \frac{(b-x)^{n-1}}{(n-1)!}f^{(n-1)}(x)$$

Since the $(n-1)^{th}$ derivative $f^{(n-1)}$ is continuous on $[a, b]$.

$\therefore f, f', f'', \dots, f^{(n-1)}$ are continuous on $[a, b]$.
 and $(b-x)^x$, $x = 1, 2, 3, \dots, n-1$
 is continuous for all x .

$\therefore f(x)$ is continuous on $[a, b]$.

$\therefore G(x)$ is continuous on $[a, b]$.

Since the n^{th} derivative $f^{(n)}$ exists on (a, b) .

$\therefore f, f', f'', \dots, f^{(n-1)}$ are differentiable on (a, b) .
 and $(b-x)^x$, $x = 1, 2, 3, \dots, (n-1)$
 is differentiable for all x .

$\therefore f(x)$ is differentiable on (a, b) .

$\therefore G(x)$ is differentiable on (a, b) .

$$\text{Now } G(a) = f(a) - \frac{(b-a)^P}{(b-a)} f(a)$$

$$= 0$$

$$\text{and } G(b) = f(b) - 0$$

$$= f(b) - f(b) - (b-b) f'(b) - \dots - \frac{(b-b)^{n-1}}{(n-1)!} f^{(n-1)}(b)$$

$$= 0$$

$$\therefore G(a) = G(b) = 0$$

$\therefore G(x)$ satisfies the conditions of

Roll's theorem,

\exists at least one real number $c \in (a, b)$

such that $G'(c) = 0$.

$$\text{But } G'(x) = f'(x) + p \cdot \frac{(b-x)^{P-1}}{(b-a)^P} f(a)$$

$$\text{Now } g'(x) = 0 - f'(x) + f'(x) - (b-x) f''(x) + (b-x) f'''(x)$$

$$- \frac{(b-x)^2}{2!} f^{(4)}(x) + \dots + \frac{(n-1)(b-x)}{(n-1)!} f^{(n-1)}(x)$$

$$- \frac{(b-x)^{n-1}}{(n-1)!} f^{(n)}(x)$$

$$\therefore f'(x) = - \frac{(b-x)^{n-1}}{(n-1)!} f^{(n)}(x) \quad \text{--- (2)}$$

$$\text{③ } G'(c) = f'(c) + p \frac{(b-c)^{P-1}}{(b-a)^P} f(a)$$

$$\Rightarrow 0 = f'(c) + p \frac{(b-c)^{P-1}}{(b-a)^P} f(a) \quad (\because G'(c) = 0)$$

$$\Rightarrow f'(c) = - \frac{p(b-c)^{P-1}}{(b-a)^P} f(a)$$

$$\Rightarrow - \frac{(b-c)^{n-1}}{(n-1)!} f^{(n)}(c) = - \frac{p(b-c)^{P-1}}{(b-a)^P} f(a) \quad (\text{from ②})$$

$$\Rightarrow f(a) = \frac{(b-a)^P (b-c)^{n-P}}{p(n-1)!} f^{(n)}(c)$$

$$\Rightarrow f(b) - f(a) - \frac{(b-a)}{1!} f'(a) - \frac{(b-a)^2}{2!} f''(a) - \dots - \frac{(b-a)^{n-1}}{(n-1)!} f^{(n-1)}(a)$$

$$= \frac{(b-a)^P (b-c)^{n-P}}{p(n-1)!} f^{(n)}(c)$$

$$\Rightarrow f(b) = f(a) + \frac{(b-a)}{1!} f'(a) + \frac{(b-a)^2}{2!} f''(a) + \dots + \frac{(b-a)^{n-1}}{(n-1)!} f^{(n-1)}(a) + \frac{(b-a)^n (b-c)^{n-p}}{P(n-1)!} f^{(n)}(c)$$

$$= P_n(a) + R_n(x)$$

Note: [i] After n terms $R_n(x) = T_{n+1}$
 $= \frac{(b-a)^p (b-c)^{n-p}}{P(n-1)!} f(c)$

for some point $c \in (a, b)$.
This formula for R_n is referred to as the
Rolle's form (or derivative form) of the
remainder.

[2]

(i) for $p=1$,
 $R_n = \frac{(b-a)(b-c)^{n-1}}{(n-1)!} f'(c)$. Called Cauchy's
form of remainder.

(ii) for $p=n$,
 $R_n = \frac{(b-a)^n}{n!} f^{(n)}(c)$. called Lagrange's
form of remainder.

[3] Another form of Taylor's Theorem:

If a function f defined on $[a, a+h]$ is
such that $f^{(n-1)}$ is continuous
on $[a, a+h]$.

(i) the $(n-1)^{th}$ derivative $f^{(n-1)}$ exists on $(a, a+h)$

(ii) the n^{th} derivative $f^{(n)}$ exists on $(a, a+h)$

then $\exists c \in (0, 1)$ such that

$$f(a+h) = f(a) + h f'(a) + \frac{h^2}{2!} f''(a) + \dots + \frac{h^{n-1}}{(n-1)!} f^{(n-1)}(a)$$

$$+ \frac{h^n (1-c)}{P(n-1)!} f^{(n)}(a+ch)$$

where p is the integer.

4. Maclaurin's theorem:

putting $a=0, h=x$ in Taylor's theorem
 i.e. If a function f defined on $[0, x]$ is such that (i) the $(n-1)^{th}$ derivative $f^{(n-1)}$ is continuous on $[0, x]$
 (ii) the n^{th} derivative $f^{(n)}$ exists on $(0, x)$

then $\exists \theta \in (0, 1)$ such that

$$f(x) = f(0) + x f'(0) + \frac{x^2}{2!} f''(0) + \dots + \frac{x^{n-1}}{(n-1)!} f^{(n-1)}(0) + \frac{x^n (1-\theta)}{n!} f^{(n)}(\theta x).$$

Taylor's and Maclaurin's series:

Let a function f be continuous derivatives of every order in $[a, a+h]$ then for all $n \in \mathbb{N}$ we have by Taylor's theorem

$$f(a+h) = f(a) + h f'(a) + \frac{h^2}{2!} f''(a) + \dots + \frac{h^{n-1}}{(n-1)!} f^{(n-1)}(a) + \frac{h^n}{n!} f^{(n)}(a+\theta h)$$

where $\theta \in (0, 1)$

$$P_n = f(a) + h f'(a) + \frac{h^2}{2!} f''(a) + \dots + \frac{h^{n-1}}{(n-1)!} f^{(n-1)}(a)$$

$$R_n = \frac{h^n}{n!} f^{(n)}(a+\theta h)$$

(which is Taylor's remainder after n terms)

$$\text{Then } f(a+h) = P_n + R_n$$

If $R_n \rightarrow 0$ as $n \rightarrow \infty$,

$$\text{we have } \lim_{n \rightarrow \infty} P_n = f(a+h)$$

⇒ The infinite series

$$f(a) + h f'(a) + \frac{h^2}{2!} f''(a) + \dots + \frac{h^{n-1}}{(n-1)!} f^{(n-1)}(a) + \dots$$

converges to $f(a+h)$

$\therefore f(a) + h f'(a) + \frac{h^2}{2!} f''(a) + \dots$ is called

Taylor's series which is eqs to $f(a+h)$.

$$\text{If } \lim_{n \rightarrow \infty} R_n = 0$$

Hence if $f: [a, a+h] \rightarrow \mathbb{R}$ possesses continuous derivatives of every order in $[a, a+h]$

and Taylor's remainder $R_n \rightarrow 0$ as $n \rightarrow \infty$

$$\text{then } f(a+h) = f(a) + h f'(a) + \frac{h^2}{2!} f''(a) + \dots + \frac{h^{n-1}}{(n-1)!} f^{(n-1)}(a) + \dots$$

→ If we put $a=0, h=x$; we get

$$f(x) = f(0) + x f'(0) + \frac{x^2}{2!} f''(0) + \dots + \frac{x^n}{n!} f^{(n)}(0)$$

This is called MacLaurin's series.

NOTE: This series is useful in finding the expansion of functions.

Problems:

$$\text{If } f(x+h) = f(x) + h f'(x) + \frac{h^2}{2!} f''(x+8h), \text{ find}$$

the value of θ as $x \rightarrow a$ if $f(x) = (x-a)^{5/2}$

Sol: Given $f(x) = (x-a)^{5/2}$

$$\Rightarrow f(x+h) = (x+h-a)^{5/2}$$

$$\text{and } f'(x) = \frac{5}{2} (x-a)^{3/2}$$

$$\Rightarrow f''(x) = \frac{15}{4} (x-a)^{1/2}$$

$$\Rightarrow f''(x+8h) = \frac{15}{4} (x+8h-a)^{1/2}$$

(26)

$$\therefore f(x+h) = f(a) + hf'(a) + \frac{h^2}{2!} f''(a+0h)$$

$$\Rightarrow (x+a)^{\frac{5}{2}} = (a-a)^{\frac{5}{2}} + h\left(\frac{5}{2}\right)(a-a)^{\frac{3}{2}} + \frac{h^2}{2}\left(\frac{15}{4}\right)(x+a)^{\frac{1}{2}}$$

when $x \rightarrow a$, we get

$$h^{\frac{5}{2}} = \frac{h^2}{2}\left(\frac{15}{4}\right)(0h)^{\frac{1}{2}}$$

$$\Rightarrow h^{\frac{5}{2}} = \frac{h^2}{2}\left(\frac{15}{4}\right)0^{\frac{1}{2}}$$

~~$$\Rightarrow \frac{8}{15} = 0^{\frac{1}{2}}$$~~

~~$$\Rightarrow 0 = \frac{64}{225}$$~~

Hence if $f(x) = f(0) + xf'(0) + \frac{x^2}{2!} f''(0x)$; find the value of θ as $x \rightarrow 1$ of $f(x) = (1-x)^{\frac{5}{2}}$

Using Taylor's theorem, show that

$$(i) \cos x \geq 1 - \frac{x^2}{2} \quad \forall x \in \mathbb{R}$$

$$(ii) 1+x + \frac{x^2}{2} < e^x < 1+x + \frac{x^2}{2}e^x, x > 0$$

$$(iii) x - \frac{x^3}{3!} < \sin x < x, x > 0$$

$$(iv) x - \frac{x^3}{3!} \leq \sin x \leq x - \frac{x^3}{3!} + \frac{x^5}{5!}, x > 0$$

Sol: (i) $\cos x \geq 1 - \frac{x^2}{2} \quad \forall x \in \mathbb{R}$

Case (i) Let $x = 0$,

$$\text{then } \cos 0 = 1 \quad ; \quad 1 - \frac{0^2}{2} = 1$$

$$\therefore \cos 0 = 1 - \frac{0^2}{2}$$

Case (ii) Let $x > 0$ and $f(x) = \cos x$

$$\Rightarrow f'(x) = -\sin x, \quad f''(x) = -\cos x$$

$$\text{Since } f(x) = f(0) + xf'(0) + \frac{x^2}{2!} f''(0x)$$

where $0 < \theta < 1$

$$\therefore \cos x = 1 - \frac{x^2}{2} \cos 0x.$$

But $\cos 0x < 1 \quad ; \quad x > 0; x > 0$

$$\therefore 1 - \frac{x^2}{2} \cos 0x > 1 - \frac{x^2}{2}$$

$$\Rightarrow \cos x > 1 - \frac{x^2}{2}$$

Case(3):let $x < 0 \Rightarrow -x > 0$ put $y = -x$; $y > 0$ By Case(2), $\cos y > 1 - \frac{y^2}{2}$

$$\Rightarrow \cos(-x) \rightarrow 1 - \frac{(-x)^2}{2}$$

$$\Rightarrow \cos x > 1 - \frac{x^2}{2}$$

combining all cases,

$$\cos x \geq 1 - \frac{x^2}{2} \quad \forall x \in \mathbb{R}$$

(ii)

$$1 + x + \frac{x^2}{2} \leq e^x \leq 1 + x + \frac{x^2}{2} e^{x^2}; \quad x > 0$$

Soln: let $f(x) = e^x$; $x > 0$

$$\text{then } f'(x) = e^x = f''(x)$$

$$\text{since } f(x) = f(0) + x f'(0) + \frac{x^2}{2!} f''(0x) \quad \text{where } 0 < 0x.$$

$$1 + x + \frac{x^2}{2} e^{0x} \leq 1 + x + \frac{x^2}{2} e^{0x} \quad \textcircled{A}$$

$$1 + x + \frac{x^2}{2} e^{0x} \leq 1 + x + \frac{x^2}{2} e^{0x}$$

$$1 + x + \frac{x^2}{2} e^{0x} \leq 1 + x + \frac{x^2}{2} e^{0x}$$

$$1 + x + \frac{x^2}{2} e^{0x} \leq 1 + x + \frac{x^2}{2} e^{0x}$$

$$1 + x + \frac{x^2}{2} e^{0x} \leq 1 + x + \frac{x^2}{2} e^{0x}$$

$$1 + x + \frac{x^2}{2} e^{0x} \leq 1 + x + \frac{x^2}{2} e^{0x} \quad (\text{by } \textcircled{A})$$

→ expand e^x as an infinite seriesSoln: let $f(x) = e^x$

$$f(x) = e^x \Rightarrow f(0) = 1$$

$$f'(x) = e^x \Rightarrow f'(0) = 1$$

$$f''(x) = e^x \Rightarrow f''(0) = e^0$$

Clearly f and its derivatives exist and are continuous for every value of x .

$$L_n(x) = \frac{x^n}{n!} e^{bx}$$
 (LFR)

$$\lim_{n \rightarrow \infty} R_n = e^{bx} + \lim_{n \rightarrow \infty} \frac{x^n}{n!} \quad \text{--- (1)}$$

$$\text{Now let } a_n = \frac{x^n}{n!} \text{ then}$$

$$\Rightarrow a_{n+1} = \frac{x^{n+1}}{(n+1)!} \text{ then}$$

$$\therefore \lim_{n \rightarrow \infty} \left(\frac{a_{n+1}}{a_n} \right) = \lim_{n \rightarrow \infty} \frac{x}{n+1} = 0 < 1$$

$$\therefore \lim_{n \rightarrow \infty} a_n = 0 \quad (\because \lim_{n \rightarrow \infty} \left(\frac{a_{n+1}}{a_n} \right) = 1 < 1 \text{ then } \lim_{n \rightarrow \infty} a_n = 0)$$

$$\therefore \lim_{n \rightarrow \infty} R_n = 0$$

\therefore the conditions of MacLaurin's series are satisfied.

$$\begin{aligned} e^x &= f(x) \\ &= f(0) + x f'(0) + \frac{x^2}{2!} f''(0) + \dots + \frac{x^n}{n!} f^{(n)}(0) + \dots \end{aligned}$$

→ Expand $\sin x$ as infinite series

$$\text{Sol: Let } f(x) = \sin x.$$

$$f(x) = f(0) + x f'(0) + \frac{x^2}{2!} f''(0) + \dots$$

Here $R_n(x)$ must be tend to '0'.

$$\text{Now } f(x) = \sin x; f'(x) = \cos x; f''(x) = -\sin x; f'''(x) = -\cos x$$

$$\therefore f(0) = 0 \quad \therefore f'(0) = 1 \quad \therefore f''(0) = 0 \quad \therefore f'''(0) = -1$$

$$f^{(4)}(x) = \sin x; \quad f^{(4)}(x) = \cos x$$

$$\therefore f^{(4)}(0) = 0 \quad \therefore f^{(4)}(0) = 1.$$

$$\text{Generally } f^{(n)}(x) = \sin \left(x + \frac{n\pi}{2} \right)$$

$\therefore f$ and all its derivatives exist and continuous for every real value of x .

$$\rightarrow f(x) = a^x$$

$$\rightarrow f(x) = \log(1+x) \text{ etc.}$$

* Extreme Values of a function:

Maxima and Minima:-

[Some definitions discussed in Pg No.(8)].

* Theorem (first derivative Test):

→ Let f be continuous on $I = [a, b]$ and let c be an interior point on I . Assume that f is differentiable on (a, c) and (c, b) . Then -

(i) If there is a neighbourhood

$(c-\delta, c+\delta) \subseteq I$ such that $f'(x) \geq 0$ for $c-\delta < x < c$ and $f'(x) \leq 0$ for $c < x < c+\delta$ then f' has maximum at c .

(ii) If there is neighbourhood $(c-\delta, c+\delta) \subseteq I$ such that $-f'(x) \leq 0$ for $c-\delta < x < c$ and $-f'(x) \geq 0$ for $c < x < c+\delta$ then f has a minimum at c .

* Theorem :

Let $I \subseteq \mathbb{R}$ be an interval, let $f: I \rightarrow \mathbb{R}$ let $c \in I$ and assume that f has a derivative at c then.

(i) If $f'(c) > 0$ then \exists a $\delta > 0$ such that $f(x) > f(c)$ for $x \in I$ such that $c < x < c+\delta$

(ii) If $f'(c) < 0$ then \exists a $\delta > 0$ such that $f(x) > f(c)$ for $x \in I$ such that $c-\delta < x < c$.

* Darboux's Theorem:-

If f is differentiable on $I = [a, b]$ and if K is a number between $f(a)$ & $f'(b)$ then $\exists c \in (a, b)$ such that $f'(c) = K$.

Proof :- Since K is number between $f(a)$ & $f'(b)$.

Suppose that $f'(a) < K < f'(b)$.

Now we define

$$g(x) = Kx - f(x) \quad \forall x \in [a, b] \quad \textcircled{1}$$

Since f is differentiable on I .

$\therefore f$ is continuous on I and Kx is a polynomial which is continuous on I .

$\therefore g(x)$ is continuous on I .

$\therefore g(x)$ attains its supremum (infimum) atleast once on $[a, b] = I$.

$$\text{since } g'(x) = K - f'(x) \quad \forall x \in [a, b]$$

$$\Rightarrow g'(a) = (K - f'(a)) > 0 \\ (\because f'(a) < K < f'(b))$$

$$\Rightarrow g'(a) > 0.$$

We know that g has derivative at a and $g'(a) > 0$. then \exists a $\delta > 0$

such that $g(x) > g(a) \quad \forall x \in I$.

such that $a < x < a+\delta$.

$\therefore g$ does not have the maximum at $x=a$.

Similarly g does not have the minimum at $x=b$.

$\therefore g$ has maximum at $c \in (a, b)$

- Interior extremum theorem
- $f'(c) = 0 \forall c \in (a, b)$
- $f'(c) = k \forall c \in (a, b)$.

* Generalised Test :-

Let I be an interval, let $x_0 \in I$ and let $n \geq 2$.

Suppose that the derivatives $f', f'', \dots, f^{(n)}$ exist and are continuous in a neighbourhood of x_0 and that

$$f'(x_0) = f''(x_0) = \dots = f^{(n-1)}(x_0) = 0$$

but $f^n(x_0) \neq 0$.

If n is even and $f^n(x_0) > 0$ then f has minimum at x_0 .

If n is even and $f^n(x_0) < 0$ then f has maximum at x_0 .

If n is odd, then f has neither a minimum nor maximum at x_0 .

First Method Working Rule for finding Maxima and Minima :-

Maxima and Minima :-

1. Denote the given function by $f(x)$.

2. Find $f'(x)$ and equate it to zero.

Let its roots be x_1, x_2, \dots

3. Find $f''(x)$, put $x = x_1$. If

$f''(x_1) < 0$, $f(x)$ has a maximum at $x = x_1$.

If $f''(x_1) > 0$, $f(x)$ has a minimum at $x = x_1$.

(4) If $f''(x_1) = 0$, find $f'''(x_1)$.

If $f'''(x_1) \neq 0$, there is neither

maximum nor minimum at $x = x_1$.

If $f'''(x_1) = 0$, find $f^{(iv)}(x_1)$.

If $f^{(iv)}(x_1) < 0$, $f(x)$ has a maximum at $x = x_1$.

If $f^{(iv)}(x_1) > 0$, $f(x)$ has a minimum at $x = x_1$, so on.

Working Rule for finding Maxima and Minima :-

(Second Method by First Derivative Test)

(1). Denote the given function by $f(x)$.

(2). Find $f'(x)$ and equate it to zero.

Let its roots be x_1, x_2, x_3, \dots

(3) Test these values in succession.

Consider $x = x_1$ (say).

If there is a neighbourhood

$x \in (x_1 - \delta, x_1 + \delta)$ such that

$f'(x) > 0$ for $x_1 - \delta < x < x_1$ and $f'(x) \leq 0$ for $x_1 < x < x_1 + \delta$ then f has maximum at x_1 .

$f'(x) \leq 0$ for $x_1 - \delta < x < x_1$ and $f'(x) \geq 0$ for $x_1 < x < x_1 + \delta$ then f has minimum at x_1 .

$f'(x) \leq 0$ (≥ 0 only) for

$x_1 - \delta < x < x_1$ and $x_1 < x < x_1 + \delta$ then

f is neither maximum nor minimum at x_1 .

(4) Similarly test all these values of x obtained in (3).

Problems :-

Examine the following function for extreme values. $(x-3)^5 (x+1)^4$.

Soln:- Let $f(x) = (x-3)^5 (x+1)^4$

$$\begin{aligned} f'(x) &= (x-3)^5 + 4(x+1)^3 + (x+1)^4 \cdot 5(x-3)^4 \\ &= (x-3)^4 (x+1)^3 [(x-3) + 5(x+1)] \\ &= (x-3)^4 (x+1)^3 [4x-12+5x+5] \\ &= (x-3)^4 (x+1)^3 [9x-7] \end{aligned}$$

for maximum or minimum $f'(x)=0$

$$\Rightarrow (x-3)^4 (x+1)^3 (9x-7) = 0$$

$$\Rightarrow [x=3, -1, \frac{7}{9}]$$

Second Method:-

Take $\alpha = 3 \in (3-\delta, 3+\delta)$; $\delta > 0$ for INSIDE

$3-\delta < x < 3 \Rightarrow f'(x) > 0$ and for

$3 < x < 3+\delta \Rightarrow f'(x) > 0$.

$\therefore f'(x) > 0$ for $3-\delta < x < 3$ and $3 < x < 3+\delta$.

$\therefore f(x)$ is neither minimum nor maximum at $x=3$.

Take $\alpha = -1 \in (-1-\delta, -1+\delta)$, $\delta > 0$

for $-1-\delta < x < -1 \Rightarrow f'(x) > 0$ and for

$-1 < x < -1+\delta \Rightarrow f'(x) < 0$

\therefore by first derivative test for

extrema,

$f(x)$ has maximum at $x=-1$.

$$\therefore f_{\max} = f(-1) = 0.$$

$$\text{Take } x = \frac{7}{9} \in \left(\frac{7}{9}-\delta, \frac{7}{9}+\delta\right)$$

for $\frac{7}{9}-\delta < x < \frac{7}{9}$:

$$\Rightarrow f'(x) < 0$$

for $\frac{7}{9} < x < \frac{7}{9}+\delta \Rightarrow f'(x) > 0$.

$\therefore f(x)$ has minimum at $x = \frac{7}{9}$.

(By first derivative test for extreme)-

$$\therefore f_{\min} = f\left(\frac{7}{9}\right) = \frac{-4 \cdot 5^5}{3^{18}}.$$

H.W Examine for maxima and minima of the function defined by

$$f(x) = x^x (1-x)^3$$

show that $\sin x (1+\cos x)$ is maximum when $x = \pi/3$.

First Method:-

Soln: Let $f(x) = \sin x (1+\cos x)$

$$\text{then } f'(x) = \cos x (1+\cos x) + \sin x (-\sin x)$$

$$= \cos^2 x - \sin^2 x + \cos x$$

$$= \cos 2x + \cos x$$

$$\text{and } f''(x) = -2\sin 2x - \sin x$$

For maxima or minima $f'(x)=0$

$$\Rightarrow \cos 2x + \cos x = 0$$

$$\Rightarrow 2\cos^2 \left(\frac{3x}{2}\right) \cos \left(\frac{x}{2}\right) = 0$$

$$\Rightarrow \text{either } \frac{3x}{2} = \frac{\pi}{2} \text{ or } x = \frac{\pi}{2}$$

$$\Rightarrow x = \frac{\pi}{3} \text{ (or) } x = \pi.$$

Here we consider only the point

$$\alpha = \frac{\pi}{3}$$

$$\begin{aligned} f''\left(\frac{\pi}{3}\right) &= -2\sin\left(\frac{2\pi}{3}\right) - 3\sin\left(\frac{\pi}{3}\right) \\ &= -2\sin(120^\circ) - \sin 60^\circ \\ &= -2\sin(180^\circ - 60^\circ) - \sin 60^\circ \\ &= -2\sin 60^\circ - \sin 60^\circ \\ &= -3\sin 60^\circ \\ &= -3\sqrt{3}/2 < 0. \end{aligned}$$

$\therefore f(x)$ has a maximum at $x = \frac{\pi}{3}$.

$$\begin{aligned} \therefore f_{\max} &= f\left(\frac{\pi}{3}\right) = \sin\frac{\pi}{3}(1 + \cos\frac{\pi}{3}) \\ &= \frac{\sqrt{3}}{2}(1 + \frac{1}{2}) \\ &= \frac{\sqrt{3}}{2} \left(\frac{3}{2}\right) = \frac{3\sqrt{3}}{4}. \end{aligned}$$

Solved

→ Find the maximum and minimum values of any of the function

$$(1-x)^2 e^x.$$

$$\text{Sofn: Let } f(x) = (1-x)^2 e^x$$

$$\begin{aligned} \text{then } f'(x) &= (1-x)^2 e^x - 2(1-x)e^x \\ &= [1+x^2-2x-2+2x]e^x \\ &= (x^2-1)e^x \end{aligned}$$

For Maximum or minimum,

$$f'(x) = 0$$

$$\Rightarrow e^x(x^2-1) = 0$$

$$\Rightarrow x^2-1 = 0 \quad (e^x \neq 0)$$

$$\Rightarrow x = \pm 1$$

$$\begin{aligned} \text{when } x = 1 : \quad f''(x) &= e^x(x^2-1) + e^x(2x) \\ &= e^x[x^2+2x-1] \\ \therefore f''(1) &= e^1(1+2-1) \end{aligned}$$

if

$$= 2e > 0$$

$\therefore f$ is minimum at $x = 1$.

$$\therefore f_{\min} = f(1) = 0.$$

$$\text{when } x = -1 : \quad f''(x) = e^x(x^2+2x-1)$$

$$\therefore f''(-1) = e^{-1}(-1-2-1)$$

$$= \frac{-9}{e} < 0$$

$\therefore f$ is maximum at $x = -1$.

$$\therefore f_{\max} = f(-1) = \frac{4}{e}$$

→ find the maximum value of $\log x$,

$$0 < x < \infty$$

$$\text{Soln: Let } f(x) = \frac{\log x}{x},$$

$$\text{then } f'(x) = \frac{x(\frac{1}{x}) - \log x}{x^2} = \frac{1 - \log x}{x^2}$$

$$\text{and } f''(x) = \frac{x^2(-\frac{1}{x^2}) - (1 - \log x) \cdot 2x}{x^4}$$

$$= \frac{-2 - 2x + 2x \log x}{x^4}$$

For maximum or minimum,

$$f'(x) = 0$$

$$\Rightarrow 1 - \log x = 0$$

$$\Rightarrow \log x = 1$$

$$\Rightarrow x = e$$

$$\text{when } x = e^{\pm i} :$$

$$-f''(e) = \frac{-e - 2e + 2e \log e}{e^4}$$

$$= \frac{-3e + 2e}{e^4}$$

$$= \frac{-e}{e^4}$$

$$= -\frac{1}{e^3} < 0.$$

f is maximum at $x=e$.

$$\therefore f_{\max} = f(e) = \frac{\log e}{e} = \frac{1}{e}$$

Prove that the function $(\frac{1}{x})^x$, $x > 0$, has a maximum at $x=1/e$.

Sol'n Let $f(x) = (\frac{1}{x})^x$; $x > 0$

$$\Rightarrow \log f(x) = x \log \frac{1}{x}$$

$$\Rightarrow \log f(x) = x[-\log x]$$

$$\Rightarrow \log f(x) = -x \log x$$

$$\Rightarrow \frac{1}{f(x)} f'(x) = -\left[\frac{x}{x^2} + \log x\right]$$

$$\Rightarrow f'(x) = -f(x)[1 + \log x]$$

and $f''(x) = -f(x)\frac{1}{x^2} - f'(x)[1 + \log x]$

For maximum (or) minimum $f'(x)=0$

$$\Rightarrow -f(x)[\log x + 1] = 0$$

$$\Rightarrow 1 + \log x = 0 \quad (\because f(x) \neq 0)$$

$$\Rightarrow \log x = -1$$

$$\Rightarrow x = e^{-1}$$

Now when $x = e^{-1}$:

$$f''(e^{-1}) = -f(e^{-1})\frac{1}{e^{-1}} - f'(e^{-1})[1 + \log(e^{-1})]$$

$$= -\left(\frac{e^{-1}}{e^{-1}-1}\right) - 0[1 + \log(e^{-1})]$$

$$= -e^{e^{-1}} \cdot e^{-1}$$

$$= -(\frac{1}{e})^e \cdot e$$

$$< 0$$

$\therefore f$ is maximum at $x=1/e$.

$$f_{\max} = f\left(\frac{1}{e}\right) = \left(\frac{1}{\frac{1}{e}}\right)^{\frac{1}{e}} = (e)^{\frac{1}{e}}$$

H.W. Prove that the function x^x , $x > 0$ has a minimum at $x=1/e$.

→ find the maximum and minimum values of the following functions:

$$\textcircled{1} \quad 2x^3 - 9x^2 + 24x - 20$$

$$\textcircled{2} \quad (x-1)(x-2)(x-3)$$

→ for each of the following functions on $\mathbb{R} \rightarrow \mathbb{R}$, find points of extrema, the intervals on which the function is increasing, and those on it is decreasing.

$$\text{i. } f(x) = x^2 - 3x + 5$$

$$\text{ii. } g(x) = 3x - 4x^2$$

$$\text{iii. } h(x) = x^3 - 3x - 4$$

Sol'n i. $f(x) = x^2 - 3x + 5$

$$f'(x) = 2x - 3$$

for maximum (or) minimum $f'(x) = 0$

$$x = \frac{3}{2}$$

Now $x = \frac{3}{2} \in (\frac{3}{2} - \delta, \frac{3}{2} + \delta)$

For $\frac{3}{2} - \delta < x < \frac{3}{2} \Rightarrow f'(x) < 0$

and $\frac{3}{2} < x < \frac{3}{2} + \delta \Rightarrow f'(x) > 0$

∴ By first derivative test for extrema

$f(x)$ has minimum at $x = \frac{3}{2}$:

$$f_{\min} = f\left(\frac{3}{2}\right) = \left(\frac{3}{2}\right)^2 - 3\left(\frac{3}{2}\right) + 5$$

$$= \frac{9}{4} - \frac{9}{2} + 5$$

$$= \frac{9 - 18 + 20}{4}$$

$$= \frac{11}{4}$$

$$\text{Now } f'(x) = 2x-3 \quad \begin{array}{c} \xrightarrow{3/2} \\ x \quad x \quad x \end{array}$$

if $x < \frac{3}{2} \Rightarrow f'(x) < 0.$

$\therefore f(x)$ is an decreasing in $(-\infty, \frac{3}{2})$

if $x > \frac{3}{2}$

$$\Rightarrow f'(x) > 0$$

$\therefore f(x)$ is an increasing in $(\frac{3}{2}, \infty)$

$$h(x) = x^3 - 3x - 4$$

$$\text{Sofn: } h'(x) = 3x^2 - 3$$

for maximum or minimum $h'(x) = 0$

$$\Rightarrow 3x^2 - 3 = 0$$

$$\Rightarrow x^2 - 1 = 0$$

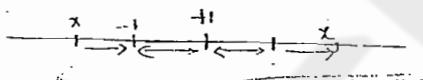

$$\Rightarrow x = \pm 1$$

At $x=1$: $h(x)$ has minimum.

At $x=-1$: $h(x)$ has maximum.

$$\text{Now } h'(x) = 3x^2 - 3$$

$$= 3(x-1)(x+1) \quad \text{--- (1)}$$

If $x < -1$

$$\Rightarrow (x-1) < 0 ; (x+1) < 0$$

$$\therefore \text{ (1)} \equiv h'(x) > 0$$

$\therefore h(x)$ is increasing in $(-\infty, -1)$

If $-1 < x < 1 \Rightarrow (x-1) < 0 ; (x+1) > 0$

$$\therefore \text{ (1)} \equiv h'(x) < 0$$

$\therefore h(x)$ is decreasing in $(-1, 1)$

If $x > 1 \Rightarrow (x-1) > 0 ; (x+1) > 0$

$\therefore \text{ (1)} \equiv h'(x) > 0$
 $\therefore h(x)$ is increasing in $(1, \infty)$.

\therefore In $(-\infty, -1) \cup (1, \infty)$,

$\therefore h(x)$ is increasing.

and in $(-1, 1)$, $h(x)$ is decreasing.

* L Hospital's Rules*

⇒ Ineterminate Forms:

If $A = \lim_{x \rightarrow c} f(x)$ and $B = \lim_{x \rightarrow c} g(x)$.

$$\text{and if } B \neq 0 \text{ then } \lim_{x \rightarrow c} \frac{f(x)}{g(x)} = \frac{A}{B}$$

However, if $B=0$ then it has no conclusion.

If $B=0$ and $A \neq 0$ then the limit is infinite. (when it exists).

If $A=0$ & $B=0$ then $\lim_{x \rightarrow c} \frac{f(x)}{g(x)}$ is

Said to be indeterminate form.

Ex:- (1) If a is any real number

and if we define $f(x) = ax$ and

$g(x) = x$ then

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{f(x)}{g(x)} &= \lim_{x \rightarrow 0} \frac{ax}{x} \quad \left| \begin{array}{l} 0/0 \text{ form} \\ \end{array} \right. \\ &= \lim_{x \rightarrow 0} (a) \\ &= a \end{aligned}$$

Ex:- (2): If $f(x) = x^2 - 1$ and $g(x) = x - 1$

(with $a=1$)

then we have

$$\begin{aligned} \lim_{x \rightarrow a} \frac{f(x)}{g(x)} &= \lim_{x \rightarrow 1} \frac{x^2 - 1}{x - 1} \quad \left| \begin{array}{l} 0/0 \text{ form} \\ \end{array} \right. \\ &= \lim_{x \rightarrow 1} (x+1) \\ &= 2 \end{aligned}$$

→ other indeterminate form are represented by the symbols $\frac{\infty}{\infty}, 0 \cdot \infty, 0^0, 1^\infty, \infty^0$ and $\infty - \infty$.

→ our attention will be focused on the indeterminate forms $\frac{0}{0}$ and $\frac{\infty}{\infty}$.

The other indeterminate cases are usually reduced to the form $\frac{0}{0}$ or $\frac{\infty}{\infty}$ by taking logarithms, exponentials, or algebraic manipulations.

* We first establish an elementary result that is based simply on the definition of the derivative.

Theorem:-

Let f and g be defined on $[a, b]$.
 let $f(a) = g(a) = 0$ and $g'(x) \neq 0$
 for $x \in (a, b)$ (i.e. $a < x < b$). If f and g are differentiable at a and if $g'(a) \neq 0$, then the limit of $\frac{f}{g}$ at a exists and is equal to $\frac{f'(a)}{g'(a)}$.

$$\text{i.e. } \lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{f'(a)}{g'(a)}$$

* Working Rule for finding the value of $\lim_{x \rightarrow a} \frac{f(x)}{g(x)}$:
 where $f(a) = g(a) = 0$.

- (1) Differentiate the numerator and denominator separately.
- (2) put $x=a$ and remove the word limit.

3) If the indeterminate form $\frac{0}{0}$ still persists, repeat the above process.

Problems :-

* Evaluate the following limits:

$$\lim_{x \rightarrow 0} \frac{(1+x)^n - 1}{x}$$

soln: $\lim_{x \rightarrow 0} \frac{(1+x)^n - 1}{x}$ | $\frac{0}{0}$ form

$$= \lim_{x \rightarrow 0} \frac{n(1+x)^{n-1}}{1} \quad (\text{By differentiating numerator & denominator separately})$$

$$= n$$

soln: $\lim_{x \rightarrow 0} \frac{xe^x - \log(1+x)}{x^2}$

soln: $\lim_{x \rightarrow 0} \frac{x - \sin x}{x^3}$

soln: $\lim_{x \rightarrow 0} \frac{\log(1-x^2)}{\log(\cos x)}$

$\lim_{x \rightarrow 1} \left(\frac{x^x - x}{1 - x + \log x} \right)$

soln: Let $u = x^x$;
then $\log u = x \log x$.

$$\Rightarrow \frac{1}{u} \frac{du}{dx} = x\left(\frac{1}{x}\right) + \log x$$

$$\Rightarrow \frac{du}{dx} = u \left(1 + \log x\right).$$

$$= x^x (1 + \log x)$$

Now $\lim_{x \rightarrow 1} \left(\frac{x^x - x}{1 - x + \log x} \right)$ | form $\frac{0}{0}$

$$= \lim_{x \rightarrow 1} \frac{x^x (1 + \log x) - 1}{-1 + \frac{1}{x}} \quad \left| \begin{array}{l} \text{form } \frac{0}{0} \\ \text{form } \frac{0}{0} \end{array} \right.$$

$$= \lim_{x \rightarrow 1} \frac{x^x \left(\frac{1}{x}\right) + x^x (1 + \log x)(1 + \log x)}{-\frac{1}{x^2}}$$

$$= \frac{1' \left(\frac{1}{x}\right) + 1' (1 + \log x)^2}{-\frac{1}{x^2}}$$

$$= \frac{1 + 1(1+0)}{-1}$$

$$= \frac{1+1}{-1} = -2$$

* L'Hospital's Rule - I :-

Let $-\infty \leq a < b \leq \infty$ and let f, g be differentiable on (a, b) such that $g'(x) \neq 0$ $\forall x \in (a, b)$

Suppose that

$$\lim_{x \rightarrow a^+} f(x) = 0 = \lim_{x \rightarrow a^+} g(x)$$

$$\textcircled{a} \text{ If } \lim_{x \rightarrow a^+} \frac{f'(x)}{g'(x)} = L \in \mathbb{R} \text{ then } \lim_{x \rightarrow a^+} \frac{f(x)}{g(x)} = L$$

$$\textcircled{b} \text{ If } \lim_{x \rightarrow a^+} \frac{f'(x)}{g'(x)} = L \in \{-\infty, \infty\} \text{ then }$$

$$\lim_{x \rightarrow a^+} \frac{f(x)}{g(x)} = L$$

Problems:-

Evaluate the following limits.

(a) $\lim_{x \rightarrow 0} \frac{e^x - 2\cos x + e^{-x}}{x \sin x}$

(b) $\lim_{x \rightarrow 0} \frac{\tan x - x}{x^2 \tan x}$

(c) $\lim_{x \rightarrow a} \frac{x^a - a^a}{x^a - a^a}$

$$= \lim_{x \rightarrow 0} \frac{\sec^2 x - 1}{3x^2} \quad \left| \begin{array}{l} \frac{0}{0} \text{ form} \\ \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{2 \sec x \sec x \tan x}{6x} \quad \left| \begin{array}{l} \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{2 \sec^2 x}{6} \cdot \lim_{x \rightarrow 0} \frac{\tan x}{x} \quad \left| \begin{array}{l} \end{array} \right.$$

$$= \frac{2(1)}{6} \cdot (1)$$

$$= \frac{1}{3}$$

$$(g) \lim_{x \rightarrow a} \frac{x^a - a^a}{x^a - a^a}$$

Let $u = x^a$ then $\log u = a \log x$

$$\Rightarrow \frac{1}{u} \frac{du}{dx} = x^{\frac{1}{a}} + a \log x$$

$$\Rightarrow \frac{du}{dx} = x^a (1 + \log x)$$

$$\lim_{x \rightarrow a} \left(\frac{x^a - a^a}{x^a - a^a} \right)$$

$$= \lim_{x \rightarrow a} \frac{x^a - a^a - a^a \log a}{x^a (1 + \log a) - a^a}$$

$$= \frac{a^a - a^a - a^a \log a}{a^a (1 + \log a)}$$

$$= \frac{a \cdot a^{a-1} - a^a \log a}{1 + \log a}$$

$$= \frac{1 - \log a}{1 + \log a}$$

→ what is wrong with the following application of L'Hospital's rule:

$$\text{Sol'n: } \lim_{x \rightarrow 1} \frac{x^3 + 3x - 4}{2x^2 + x - 3} \quad \left| \begin{array}{l} \frac{0}{0} \text{ form} \\ \end{array} \right.$$

$$= \lim_{x \rightarrow 1} \frac{3x^2 + 3}{4x + 1} \quad \left| \begin{array}{l} \frac{0}{0} \text{ form} \\ \end{array} \right.$$

$$= \lim_{x \rightarrow 1} \frac{3x^2 + 3}{4x + 1}$$

Now the expression $\frac{3x^2 + 3}{4x + 1}$ is not of the form $\frac{0}{0}$ as $x \rightarrow 1$

∴ It is not correct to apply

L'Hospital's Rule to evaluate $\lim_{x \rightarrow 1} \frac{3x^2 + 3}{4x + 1}$

$$\therefore \lim_{x \rightarrow 1} \frac{3x^2 + 3}{4x + 1} = \frac{3(1) + 3}{4(1) + 1} = \frac{6}{5}$$

→ what is wrong with the following use of L'Hospital's Rule:

$$\lim_{x \rightarrow 1} \frac{x^4 - 4x^3 + 3}{3x^2 - x - 2} = \lim_{x \rightarrow 1} \frac{4x^3 - 12x^2}{6x - 1}$$

$$= \lim_{x \rightarrow 0} \frac{12x^2 - 24x}{6}$$

$$= -2$$

→ For what value of 'a' does $\frac{\sin 2x + a \sin x}{x^2}$ tend to a finite

limit l as $x \rightarrow 0$? when 'a' has this value, what is the value of l?

$$\text{Sol'n: } \lim_{x \rightarrow 0} \frac{\sin 2x + a \sin x}{x^3} \quad \left| \begin{array}{l} \text{form } \frac{0}{0} \\ \text{form } \frac{0}{0} \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{2\cos 2x + a \cos x}{3x^2} \quad \text{(i)}$$

The denominator (i) $\rightarrow 0$ as $x \rightarrow 0$ but (i) \rightarrow a finite limit l.

∴ The numerator $(2\cos 2x + a \cos x)$ must be tend to zero as $x \rightarrow 0$.

$$\therefore 2\cos(0) + a\cos(0) = 0$$

$$\Rightarrow 2+a=0$$

$$\Rightarrow a = -2$$

With this value of a

$$(i) = \lim_{x \rightarrow 0} \frac{2\cos 2x - 2\cos x}{3x^2} \quad \left| \begin{array}{l} \text{form } \frac{0}{0} \\ \text{form } \frac{0}{0} \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{-4\sin 2x + 2\sin x}{6x} \quad \left| \begin{array}{l} \text{form } \frac{0}{0} \\ \text{form } \frac{0}{0} \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{-8\cos 2x + 2\cos x}{6} \quad \left| \begin{array}{l} \text{form } \frac{0}{0} \\ \text{form } \frac{0}{0} \end{array} \right.$$

$$= \frac{-8(1) + 2(1)}{6} = -6/6 = -1$$

$$\therefore l = -1$$

→ Find the values of 'a' and 'b' in order that $\lim_{x \rightarrow 0} \frac{x(1-a\cos x) + b\sin x}{x^3}$

may be equal to $\frac{1}{3}$.

$$\text{Sol'n: } \lim_{x \rightarrow 0} \frac{x(1-a\cos x) + b\sin x}{x^3} \quad \left| \begin{array}{l} \text{form } \frac{0}{0} \\ \text{form } \frac{0}{0} \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{x(a\sin x) + (1-a\cos x) + b\cos x}{3x^2} \quad \text{(i)}$$

The denominators of (i) $\rightarrow 0$ as $x \rightarrow 0$ but (i) $\rightarrow \frac{1}{3}$ as $x \rightarrow 0$.

∴ The numerator of (i).

$a(\sin x) + (1-a\cos x) + b\cos x$ tends to zero as $x \rightarrow 0$.

$$\Rightarrow 0(0) + (1-a(1)) + b(1) = 0$$

$$\Rightarrow 1-a+b=0 \quad \text{(2)}$$

If the relation (2) holds then from (i)

$$\lim_{x \rightarrow 0} \frac{ax\sin x + (1-a\cos x) + b\cos x}{3x^2}$$

(is of the form $\frac{0}{0}$)

$$= \lim_{x \rightarrow 0} \frac{a\sin x + ax\cos x + 1 - a\cos x - b\sin x}{6x} \quad \left| \begin{array}{l} \text{form } \frac{0}{0} \\ \text{form } \frac{0}{0} \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{a\cos x + a\cos x - ax\sin x + a\cos x - b\cos x}{6} \quad \left| \begin{array}{l} \text{form } \frac{0}{0} \\ \text{form } \frac{0}{0} \end{array} \right.$$

$$= \frac{a(1) + a(1) - a(0) + a(1) - b(1)}{6}$$

$$= \frac{3a-b}{6}$$

but the limit of (i) equal to $\frac{1}{3}$ (given)

$$\therefore \frac{3a-b}{6} = \frac{1}{3}$$

$$\Rightarrow 3a - b = 2 \quad \text{--- (3)}$$

From (2) & (3), we get

$$a = \frac{1}{2}, b = -\frac{1}{2}$$

H.W. Find the values of p and q for which $\lim_{x \rightarrow 0} \frac{x(1 + p \cos x) - q \sin x}{x^3}$ exists

and equals 1.

2006 P-I find the values of a and b such that

$$\lim_{x \rightarrow 0} \frac{a \sin^2 x + b \log \cos x}{x^4} = \frac{1}{2}$$

$$\text{Sol'n: } \lim_{x \rightarrow 0} \frac{a \sin^2 x + b \log \cos x}{x^4} \quad | \text{ form } \frac{0}{0}$$

$$= \lim_{x \rightarrow 0} \frac{a(2 \sin x \cos x) + b(-\sin x)}{4x^3}$$

$$= \lim_{x \rightarrow 0} \frac{a \sin 2x - b \tan x}{4x^3} \quad | \text{ form } \frac{0}{0}$$

$$= \lim_{x \rightarrow 0} \frac{2a \cos 2x - b \sec^2 x}{12x^2} \quad \text{--- (1)}$$

The denominator of (1) $\rightarrow 0$ as $x \rightarrow 0$.

but (1) \rightarrow a finite limit value $\frac{1}{2}$.

\therefore The numerator of (1) must be zero as $x \rightarrow 0$.

$$\therefore (1) \equiv 2a \cos(0) - b \sec^2(0) = 0$$

$$\Rightarrow 2a - b = 0 \quad \text{--- (2)}$$

with this form (1).

34

$$\lim_{x \rightarrow 0} \frac{2a \cos 2x - b \sec^2 x}{12x^2} \quad | \text{ form } \frac{0}{0}$$

$$= \lim_{x \rightarrow 0} \frac{-4a \sin 2x - b[2 \sec^2 x \tan x]}{24x} \quad | \text{ form } \frac{0}{0}$$

$$= \lim_{x \rightarrow 0} \left[\frac{-4a \sin x}{24x} - \frac{2b \sec^2 x \tan x}{24x} \right]$$

$$= \frac{-a}{3} \lim_{x \rightarrow 0} \frac{\sin x}{2x} + \frac{b}{12} \lim_{x \rightarrow 0} \sec^2 x \lim_{x \rightarrow 0} \frac{\tan x}{x}$$

$$= \frac{-a}{3}(1) + \frac{b}{12}(1)(1)$$

$$= \frac{-a}{3} + \frac{b}{12} = \frac{-4a+b}{12}$$

but limit of (1) is equal to $\frac{1}{2}$

$$\therefore \frac{-4a+b}{12} = \frac{1}{2}$$

$$\Rightarrow -4a + b = 6 \quad \text{--- (3)}$$

$$(2) - (3) \Rightarrow 6a = 6$$

$$\Rightarrow [a = 1]$$

$$(2) \equiv 2(1) - b = 0$$

$$\Rightarrow 2 - b$$

$$\Rightarrow [b = 2]$$

$$\therefore a = 1, b = 2$$

* Hospital's Rule - 2:

Let $-\infty \leq a < b \leq \infty$ and let

f.g be differentiable on (a, b) .

such that $g'(x) \neq 0 \forall x \in (a, b)$

Suppose that $\lim_{x \rightarrow a^+} g(x) = \pm \infty$.

④ If $\lim_{x \rightarrow a+} \frac{f(x)}{g(x)} = L \in \mathbb{R}$ then

$$\lim_{x \rightarrow a+} \frac{f(x)}{g(x)} = L$$

⑤ If $\lim_{x \rightarrow a+} \frac{f(x)}{g(x)} = L \in \{-\infty, \infty\}$, then

$$\lim_{x \rightarrow a+} \frac{f(x)}{g(x)} = L$$

Note! In most of the Problems of the form $\frac{\infty}{\infty}$, it is necessary to change it into the form $\frac{0}{0}$ at the Proper stage, otherwise the process will never end.

Problems:

Evaluate the following limits:

① $\lim_{x \rightarrow 0} \frac{\log x^2}{\cot x^2}$

Sol'n:

$$= \lim_{x \rightarrow 0} \frac{2 \log x}{\cot x^2} \quad \left| \begin{array}{l} \text{form } \frac{\infty}{\infty} \\ \because \log 0 = -\infty \\ \& \cot 0 = \infty \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{2 \cdot \frac{1}{x}}{(-\csc^2 x^2) (2x)}$$

$$= \lim_{x \rightarrow 0} \frac{-2}{2x^2 (\csc^2 x^2)}$$

$$= \lim_{x \rightarrow 0} \left(\frac{\sin^2 x^2}{x^2} \right) \quad \left| \begin{array}{l} \text{0/0 form} \\ \text{as } x \rightarrow 0, \sin x^2 \rightarrow 0 \end{array} \right.$$

$$= \lim_{x \rightarrow 0} \frac{-2 \sin^2 x^2 \cdot \cos x^2 \cdot (2x)}{2x}$$

$$= \lim_{x \rightarrow 0} -\sin(2x^2)$$

$$= 0$$

$$\lim_{x \rightarrow \pi/2} \frac{\log(\theta - \pi/2)}{\tan \theta}$$

$$\lim_{x \rightarrow 0} \frac{\cot x}{\log x}$$

$$\lim_{x \rightarrow \pi/2} \frac{\tan 5x}{\tan x}$$

$$\lim_{x \rightarrow 0+} \frac{\log(\tan x)}{\log x}$$

$$\text{Sol'n: } \lim_{x \rightarrow 0+} \frac{\log(\tan x)}{\log x} \quad \left| \begin{array}{l} \text{0/0 form} \\ \text{as } x \rightarrow 0, \tan x \rightarrow 0 \end{array} \right.$$

$$= \lim_{x \rightarrow 0+} \left[\frac{1}{\tan x} \sec^2 x \right]_{Y_x}$$

$$= \lim_{x \rightarrow 0+} \frac{x}{\sin x \cos x}$$

$$= \lim_{x \rightarrow 0+} \frac{2x}{\sin 2x} \quad \left| \begin{array}{l} \text{0/0 form} \\ \text{as } x \rightarrow 0, \sin 2x \rightarrow 0 \end{array} \right.$$

$$= \lim_{x \rightarrow 0+} \frac{2}{2 \cos 2x}$$

$$= \frac{2}{2(1)} = 1$$

Other Indeterminate forms:

The indeterminate forms $\infty - \infty$,

$0 \times \infty$, ∞^0 , 0^0 , ∞^∞ can be

reduced to any one of the two indeterminate forms $\frac{0}{0}$ or $\frac{\infty}{\infty}$

by algebraic manipulations and the exponential functions.

This is illustrated by the

following examples.

Form $\infty - \infty$

$$\lim_{x \rightarrow 0^+} \left(\frac{1}{x} - \frac{1}{\sin x} \right)$$

$$\text{Sol'n: } \lim_{x \rightarrow 0^+} \left(\frac{1}{x} - \frac{1}{\sin x} \right) \quad | \begin{matrix} \infty - \infty \\ \text{form} \end{matrix}$$

$$= \lim_{x \rightarrow 0^+} \frac{\sin x - x}{x \sin x} \quad | \begin{matrix} \text{form } \frac{0}{0} \\ 0 \end{matrix}$$

$$= \lim_{x \rightarrow 0^+} \frac{\cos x - 1}{x \cos x + \sin x} \quad | \begin{matrix} \text{form } \frac{0}{0} \\ 0 \end{matrix}$$

$$= \lim_{x \rightarrow 0^+} \frac{\sin x}{-x \sin x + 2 \cos x}$$

$$= \frac{0}{2} = 0$$

$$\text{Hence: } \lim_{x \rightarrow 0^+} \left(\frac{1}{x} - \frac{1}{\sin x} \right)$$

$$\text{Hence: } \lim_{x \rightarrow 0^+} \left(\frac{1}{x} - \cot x \right)$$

$$\text{Hence: } \lim_{x \rightarrow \pi/2^-} \left(\sec x - \tan x \right)$$

$$\text{Hence: } \lim_{x \rightarrow 0^+} \left[\frac{1}{x} - \frac{1}{x^2} \log(1+x) \right]$$

35

$$\lim_{x \rightarrow 0^+} \left[\frac{\pi}{4x} - \frac{\pi}{2x(e^{\pi x} + 1)} \right]$$

$$\lim_{x \rightarrow 1^-} \left[\frac{2}{x^2 - 1} - \frac{1}{x-1} \right]$$

$$\lim_{x \rightarrow 4^+} \left[\frac{1}{\log(x-3)} - \frac{1}{x-4} \right]$$

$$\lim_{x \rightarrow 0^+} \left[\frac{1}{e^x - 1} - \frac{1}{x} \right]$$

$$\lim_{x \rightarrow 0^+} \left[\cot^2 x - \frac{1}{x^2} \right]$$

$$\text{Sol'n: } \lim_{x \rightarrow 0^+} \left(\cot^2 x - \frac{1}{x^2} \right) \quad | \begin{matrix} \infty - \infty \\ \text{form} \end{matrix}$$

$$= \lim_{x \rightarrow 0^+} \left(\frac{\cot^2 x}{\sin^2 x} - \frac{1}{x^2} \right)$$

$$= \lim_{x \rightarrow 0^+} \frac{x^2 \cos^2 x - \sin^2 x}{x^2 \sin^2 x}$$

$$= \lim_{x \rightarrow 0^+} \frac{x^2 \cos^2 x - \sin^2 x}{x^4} \cdot \frac{x^2}{\sin^2 x}$$

$$= \lim_{x \rightarrow 0^+} \frac{x^2 \cos^2 x - \sin^2 x}{x^4} \left(\frac{\lim_{x \rightarrow 0^+} x}{\sin x} \right)^2$$

$$= \lim_{x \rightarrow 0^+} \frac{x^2 \cos^2 x - \sin^2 x}{x^4} \cdot (1)^2$$

$$= \lim_{x \rightarrow 0^+} \frac{x^2 \left(\frac{1 + \cos 2x}{2} \right) - \left(\frac{1 - \cos 2x}{2} \right)}{x^4}$$

$$= \lim_{x \rightarrow 0^+} \frac{x^2 (1 + \cos 2x) - (1 - \cos 2x)}{2x^4}$$

$$= \lim_{x \rightarrow 0^+} \frac{(x^2 - 1) + (x^2 + 1)(\cos 2x)}{2x^4} \quad | \begin{matrix} \frac{0}{0} \\ \text{form} \end{matrix}$$

$$\lim_{x \rightarrow 0} \frac{2x - (x^2 + 1) \left(\frac{3 \ln 2x}{2} \right) + 2x \cos 2x}{8x^3}$$

$$\lim_{x \rightarrow 0} \frac{2 + 2 \cos 2x - 4x \sin 2x - 4x \ln 2x - 4(x^2 + 1) \cos 2x}{8x^2}$$

$\frac{0}{0}$ form

$$\lim_{x \rightarrow 0} \frac{-8 \sin 2x - 16x \cos 2x - 8x \cos 2x + 2(4x^2 + 2) \sin 2x}{48x}$$

$$\lim_{x \rightarrow 0} \frac{-24x \cos 2x + (8x^2 - 4) \sin 2x}{48x} \quad \text{from } \frac{0}{0}$$

$$\lim_{x \rightarrow 0} \frac{-24 \cos 2x + 48x \sin 2x + 16x \sin 2x + 2(8x^2 - 4) \cos 2x}{48}$$

$$= \frac{-24 + 0 + 0 - 8}{48} = \frac{-32}{48} = -\frac{2}{3}$$

Form $0 \times \infty$:

Evaluate the following limits:

$$\lim_{x \rightarrow 0+} x \ln x$$

$$\text{Sol'n: } \lim_{x \rightarrow 0+} x \ln x \quad \text{from } \frac{0}{\infty} \text{ form}$$

$$= \lim_{x \rightarrow 0+} \frac{\log x}{\frac{1}{x}}$$

$$= \lim_{x \rightarrow 0+} \frac{\frac{1}{x}}{-\frac{1}{x^2}}$$

$$= \lim_{x \rightarrow 0+} \frac{-x^2}{x}$$

$$= \lim_{x \rightarrow 0+} (-x)$$

$$= 0$$

$$\lim_{x \rightarrow 0} x^3 \ln x$$

$$\lim_{x \rightarrow 0} \frac{1}{x(\ln x)^2}$$

$$\text{Sol'n: } \lim_{x \rightarrow 0} \frac{1}{x(\ln x)^2} \quad \text{from } \frac{0}{0}$$

$$= \lim_{x \rightarrow 0} \frac{y_x}{(\ln x)^2} \quad \text{from } \frac{\infty}{\infty}$$

$$= \lim_{x \rightarrow 0} \frac{-\frac{1}{x^2}}{2(\ln x)^{\frac{1}{x}}}$$

$$= \lim_{x \rightarrow 0} \frac{-\frac{1}{x}}{2 \ln x} \quad \text{from } \frac{\infty}{\infty}$$

$$= \lim_{x \rightarrow 0} \frac{\frac{1}{x^2}}{2(\ln x)}$$

$$= \lim_{x \rightarrow 0} \frac{1}{2x}$$

$$= \infty$$

$$\lim_{x \rightarrow \infty} \frac{x^3}{e^x} = l.$$

Forms : $0^0, 1^\infty, \infty^\infty$

$$\lim_{x \rightarrow 0+} x^x = ?$$

$$\text{Sol'n: } \lim_{x \rightarrow 0+} x^x = e \quad \text{from } 0^0 \text{ form}$$

$$\Rightarrow \log \left[\lim_{x \rightarrow 0+} x^x \right] = \log e$$

$$\Rightarrow \lim_{x \rightarrow 0+} [\log(x^x)] = \log e$$

$$\Rightarrow \log l = \lim_{x \rightarrow 0+} [x \ln x] \quad \text{from } \frac{0}{\infty}$$
